## 1. Introduction

We consider the Lane-Emden Dirichlet problem

$$
\begin{cases}-\Delta u=|u|^{p-1} u & \text { in } \Omega,  \tag{1.1}\\ u=0 & \text { on } \partial \Omega\end{cases}
$$

where $p>1$ and $\Omega \subset \mathbb{R}^{2}$ is a smooth bounded domain.
The aim of this paper was to provide a precise description of the asymptotic behavior, as $p \rightarrow+\infty$, of positive solutions of (1.1) under a uniform bound of their energy, namely we consider any family ( $u_{p}$ ) of positive solutions to (1.1) satisfying the condition

$$
\begin{equation*}
p \int_{\Omega}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x \rightarrow \beta \in \mathbb{R}, \quad \text { as } p \rightarrow+\infty \tag{1.2}
\end{equation*}
$$

[^0]
## F. De Marchis et al.

Before stating our results let us review some known ones. The first papers performing an asymptotic analysis of (1.1), as $p \rightarrow+\infty$, are $[12,13]$ where the authors prove a 1-point concentration phenomenon for least energy (hence positive) solutions to (1.1) and derive some asymptotic estimates. Note that least energy solutions $\left(u_{p}\right)$ of the 2-dimensional Lane-Emden problem satisfy the condition

$$
\begin{equation*}
p \int_{\Omega}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x \rightarrow 8 \pi e \in \mathbb{R}, \quad \text { as } p \rightarrow+\infty \tag{1.3}
\end{equation*}
$$

which is a particular case of (1.2). Later, Adimurthi and Grossi [1] identified a limit problem by showing that suitable scalings of the least energy solutions $\left(u_{p}\right)$ converge in $C_{\mathrm{loc}}^{2}\left(\mathbb{R}^{2}\right)$ to a regular solution $U$ of the Liouville problem

$$
\left\{\begin{array}{l}
-\Delta U=e^{U}  \tag{1.4}\\
\int_{\mathbb{R}^{2}} e^{U} \mathrm{~d} x=8 \pi .
\end{array}\right.
$$

They also showed that $\left\|u_{p}\right\|_{\infty}$ converges to $\sqrt{e}$ as $p \rightarrow+\infty$, as it had been previously conjectured. Note that solutions to (1.1), satisfying (1.2) do not blow up as $p \rightarrow+\infty$ (unlike the higher dimensional case when $p$ approaches the critical exponent). Concerning general positive solutions (i.e. not necessarily with least energy) a first asymptotic analysis was carried out in [5] (see also [6]) showing that, under the condition (1.2), all solutions $\left(u_{p}\right)$ concentrate at a finite number of points in $\bar{\Omega}$. Moreover, for each concentration point, there exists at least a sequence of points converging to it such that suitable scalings of $\left(u_{p}\right)$ about these points converge to the regular bubble $U$ satisfying (1.4). In all the introduction we briefly indicate these sequences of points as concentrating sequences and refer to Sect. 2 and to Proposition 2.2 for their precise definition. Let us observe that this result holds even for sign changing solutions and can be also obtained substituting (1.2) by a uniform bound on the Morse index of the solutions ( $u_{p}$ ) (see [4]). This first general result has been also exploited in [5] to study the asymptotic behavior of some families $\left(v_{p}\right)$ of sign changing solutions in symmetric domains, proving that suitable scalings of the positive parts $\left(v_{p}^{+}\right)$converge to the function $U$ in (1.4) while suitable scalings and translations of the negative parts $\left(v_{p}^{-}\right)$converge to a singular radial solution of

$$
\left\{\begin{array}{l}
-\Delta V=e^{V}+H \delta_{0} \quad \text { in } \mathbb{R}^{2}  \tag{1.5}\\
\int_{\mathbb{R}^{2}} e^{V} \mathrm{~d} x<+\infty
\end{array}\right.
$$

where $H$ is a suitable constant and $\delta_{0}$ is the Dirac measure concentrated at the origin. A similar result had been previously shown in [8] in the case of nodal radial solutions in the ball. Thus the limit profile of these sign-changing solutions looks like a superposition of two bubbles, related to different limit problems, one coming from the concentration of the positive parts and another coming from the concentration of the negative parts, both at the same point.

As far as positive solutions are concerned, in [5] a few consequences were derived by the main theorem, but we were not able to characterize completely the asymptotic profile. In particular it was not clear whether there could be
more than one concentrating sequence approaching each concentration point, namely a bubble tower profile.

In this paper we complete the asymptotic analysis of positive solutions started in [5]. More precisely, by the general result of [5] and the new ones proved here, we obtain the following:

Theorem 1.1. Let $\left(u_{p}\right)$ be a family of positive solutions to (1.1) satisfying (1.2).

Then there exists a finite set of points $\mathcal{S}=\left\{x_{1}, \ldots, x_{k}\right\} \in \Omega, k \in \mathbb{N} \backslash\{0\}$ such that, up to sequences, $\left(u_{p}\right)$ satisfies the following properties:
(i) $\sqrt{p} u_{p} \rightarrow 0$ in $C_{\mathrm{loc}}^{2}(\bar{\Omega} \backslash \mathcal{S})$ as $p \rightarrow+\infty$;
(ii)

$$
p u_{p}(x) \rightarrow 8 \pi \sum_{i=1}^{k} m_{i} G\left(x, x_{i}\right) \quad \text { in } C_{\mathrm{loc}}^{2}(\bar{\Omega} \backslash \mathcal{S}) \text { as } p \rightarrow+\infty
$$

where $m_{i}:=\lim _{p \rightarrow+\infty}\left\|u_{p}\right\|_{L^{\infty}\left(\overline{B_{\delta}\left(x_{i}\right)}\right)}$, for $\delta>0$ sufficiently small and $G$ is the Green's function of $-\Delta$ in $\Omega$ under Dirichlet boundary conditions; (iii)

$$
\begin{equation*}
p \int_{\Omega}\left|\nabla u_{p}(x)\right|^{2} \mathrm{~d} x \rightarrow 8 \pi \sum_{i=1}^{k} m_{i}^{2} \quad \text { as } p \rightarrow+\infty \tag{1.6}
\end{equation*}
$$

(iv) the concentration points $x_{i}, i=1, \ldots, k$, satisfy

$$
\begin{equation*}
m_{i} \nabla_{x} H\left(x_{i}, x_{i}\right)+\sum_{\ell \neq i} m_{\ell} \nabla_{x} G\left(x_{i}, x_{\ell}\right)=0 \tag{1.7}
\end{equation*}
$$

where

$$
\begin{equation*}
H(x, y)=G(x, y)+\frac{\log (|x-y|)}{2 \pi} \tag{1.8}
\end{equation*}
$$

is the regular part of the Green's function $G$;
(v)

$$
m_{i} \geq \sqrt{e}, \quad \forall i=1, \ldots, k
$$

Note that in particular we get

$$
\lim _{p \rightarrow+\infty}\left\|u_{p}\right\|_{\infty} \geq \sqrt{e}
$$

and by (1.2) and (1.6) it follows that

$$
\beta=8 \pi \sum_{i=1}^{k} m_{i}^{2} \geq k 8 \pi e
$$

so that the number of concentration points $k$ is estimated by

$$
k \leq\left[\frac{\beta}{8 \pi e}\right]
$$

The existence of the set of points $\mathcal{S}$ satisfying (i) was already proved in [5], while the statements (ii)-(v) are the new contributions of this paper. To prove them we start from the asymptotic analysis performed in [5] (see

## F. De Marchis et al.

Sect. 2) and then we follow some arguments used in [14] to study the asymptotic behavior of solutions of a fourth-order biharmonic equation in $\mathbb{R}^{4}$. Even though in the introduction of [14] it is observed that some estimates also apply to the second-order case, the passage to second-order equations is not straightforward; moreover, the proofs of several formulas with full details must be given.

Let us point out that as a byproduct of our proof we get that all the concentration points of positive solutions to (1.1) are simple (and isolated) in the sense that there is no more than one concentrating sequences of points converging at the same point. Indeed the number $k$ of concentration points in Theorem 1.1 coincides with the maximal number of concentrating sequences of points (see Proposition 5.1 in Sect. 5). Moreover, unlike the case of signchanging solutions the only limit profiles obtained by scaling the positive solutions are the regular bubbles $U$ while the singular Liouville problem in $\mathbb{R}^{2}$ is not involved.

Remark 1.2. As observed before, for least energy solutions the limit (1.3) holds so that Theorem 1.1 implies that $k=1$, which was known from [13], and that $\lim _{p \rightarrow+\infty}\left\|u_{p}\right\|_{\infty}=\sqrt{e}$, which was already proved in [1].

We conjecture that for any family of positive solutions $u_{p}$ satisfying (1.2) the following should hold:

$$
\begin{equation*}
m_{i}=\sqrt{e}, \quad \forall i=1, \ldots, k \tag{1.9}
\end{equation*}
$$

and so in particular that $\lim _{p \rightarrow+\infty}\left\|u_{p}\right\|_{\infty}=\sqrt{e}$.
Note that if (1.9) held true we would have a quantization of the energy, namely the limit energy level $\beta$ in (1.2) would be exactly

$$
\beta=k 8 \pi e, \quad k \in \mathbb{N} \backslash\{0\} .
$$

Hence, for $p$ large, positive solutions $\left(u_{p}\right)$ to (1.1) could exist only at levels of energy $p \int_{\Omega}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x$ close to a multiple of $8 \pi e$. Therefore, for positive solutions of Lane-Emden problems in dimension two the constant $8 \pi e$ would play the same role as the Sobolev constant $S$ in dimension higher than or equal to 3 .

We recall that concentrating positive solutions satisfying (1.9) have been constructed in [7] for non simply connected domains.

The outline of the paper is the following: in Sect. 2 we recall preliminary results. In Sect. 3 we show that the concentration points cannot belong to the boundary of $\Omega$. In Sect. 4 we analyze the rescaling around the local maxima of $u_{p}$. In Sect. 5 we conclude the proof of Theorem 1.1.

## 2. Preliminary results

We start by recalling the classical Pohozaev identity.

Lemma 2.1 (Pohozaev identity $[10,11]$ ). Let $A \subset \mathbb{R}^{2}$ be a smooth bounded domain, $u \in C^{2}(\bar{A})$ a solution of $-\Delta u=f(u)$ and $F(u)=\int_{0}^{u} f(t) \mathrm{d} t$. Then

$$
\begin{align*}
2 \int_{A} F(u) \mathrm{d} x= & \int_{\partial A} F(u(x))\langle x-y, \nu(x)\rangle \mathrm{d} s_{x}-\frac{1}{2} \int_{\partial A}|\nabla u(x)|^{2}\langle x-y, \nu(x)\rangle \mathrm{d} s_{x} \\
& +\int_{\partial A}\langle x-y, \nabla u(x)\rangle\langle\nabla u(x), \nu(x)\rangle \mathrm{d} s_{x} \tag{2.1}
\end{align*}
$$

where $\nu(x)$ denotes the outer normal at $\partial A$ at $x$, and $y \in \mathbb{R}^{2}$.
Assuming that $\partial \Omega \in C^{2}$, we consider the Green's function of $-\Delta$ on $\Omega$ under Dirichlet boundary conditions, namely the function $G$ which satisfies for any $y \in \Omega$

$$
\begin{cases}-\Delta_{x} G(x, y)=\delta_{y}(x) & x \in \Omega  \tag{2.2}\\ G(x, y)=0 & x \in \partial \Omega\end{cases}
$$

where $\delta_{y}$ is the Dirac mass supported in $y$.
We denote by $H(x, y)$ the regular part of $G$, namely

$$
\begin{equation*}
H(x, y)=G(x, y)+\frac{1}{2 \pi} \log |x-y| \tag{2.3}
\end{equation*}
$$

which satisfies, for all $y \in \Omega$ :

$$
\begin{cases}-\Delta_{x} H(x, y)=0 & x \in \Omega  \tag{2.4}\\ H(x, y)=\frac{1}{2 \pi} \log |x-y| & x \in \partial \Omega\end{cases}
$$

We recall that $H$ is a smooth function in $\Omega \times \Omega, G$ and $H$ are symmetric in $x$ and $y$. Moreover by the comparison principle

$$
\begin{equation*}
\frac{1}{2 \pi} \log |x-y|<H(x, y) \leq C \quad \forall x, y \in \Omega \tag{2.5}
\end{equation*}
$$

from which

$$
\begin{equation*}
G(x, y)>0 \quad \forall x, y \in \Omega \tag{2.6}
\end{equation*}
$$

and there exists $C_{\delta}>0$ such that

$$
\begin{equation*}
G(x, y) \leq C_{\delta} \quad \forall|x-y| \geq \delta>0 \tag{2.7}
\end{equation*}
$$

One can also prove that (see for instance [3, Lemma A.2])

$$
\frac{\partial H}{\partial \nu_{x}}(x, y)=\frac{1}{2 \pi} \frac{\partial}{\partial \nu_{x}}(\log |x-y|)+O(1), \quad \forall x \in \partial \Omega, \forall y \in \Omega
$$

from which

$$
\begin{equation*}
\left|\frac{\partial G}{\partial \nu_{x}}(x, y)\right| \leq C, \quad \forall x \in \partial \Omega, \quad \forall y \in \Omega \tag{2.8}
\end{equation*}
$$

Moreover (see for instance [2]), one also has

$$
\begin{equation*}
\left|\nabla_{x} G(x, y)\right| \leq \frac{C}{|x-y|} \quad \forall x, y \in \Omega, x \neq y \tag{2.9}
\end{equation*}
$$

Next we recall results already known about the asymptotic behavior of a general family ( $u_{p}$ ) of nontrivial solutions of (1.1), even sign-changing, satisfying the condition (1.2). This part is mainly based on some of the results contained in [5], plus smaller additions or minor improvements.

## F. De Marchis et al.

In [12] it has been proved that for any family $\left(u_{p}\right)$ of nontrivial solutions of (1.1) the following lower bound holds:

$$
\begin{equation*}
\liminf _{p \rightarrow+\infty} p \int_{\Omega}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x \geq 8 \pi e \tag{2.10}
\end{equation*}
$$

which implies that the constant $\beta$ in (1.2) satisfies $\beta \geq 8 \pi e$.
If we denote by $E_{p}$ the energy functional associated with (1.1), i.e.

$$
E_{p}(u):=\frac{1}{2}\|\nabla u\|_{2}^{2}-\frac{1}{p+1}\|u\|_{p+1}^{p+1}, \quad u \in H_{0}^{1}(\Omega)
$$

since for a solution $u$ of (1.1)

$$
\begin{equation*}
E_{p}(u)=\left(\frac{1}{2}-\frac{1}{p+1}\right)\|\nabla u\|_{2}^{2}=\left(\frac{1}{2}-\frac{1}{p+1}\right)\|u\|_{p+1}^{p+1} \tag{2.11}
\end{equation*}
$$

then (1.2) and (2.10) are equivalent to lower bounds for the limit of the energy $E_{p}$ or for the $L^{p+1}$-norm, namely
$\lim _{p \rightarrow+\infty} 2 p E_{p}\left(u_{p}\right)=\lim _{p \rightarrow+\infty} p \int_{\Omega}\left|u_{p}\right|^{p+1} \mathrm{~d} x=\lim _{p \rightarrow+\infty} p \int_{\Omega}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x=\beta \geq 8 \pi e ;$ we will use all these equivalent formulations in the sequel.
Observe that by the assumption in (1.2) we have that

$$
E_{p}\left(u_{p}\right) \rightarrow 0, \quad\left\|\nabla u_{p}\right\|_{2} \rightarrow 0, \quad \text { as } p \rightarrow+\infty
$$

so in particular $u_{p} \rightarrow 0$ a.e. as $p \rightarrow+\infty$.
On the other side it is known that the solutions $u_{p}$ do not vanish as $p \rightarrow+\infty$ and that they do not blow-up, unlike the higher dimensional case. Indeed the following results hold:

Proposition 2.2. Let $\left(u_{p}\right)$ be a family of solutions to (1.1) satisfying (1.2). Then
(i) (No vanishing).

$$
\left\|u_{p}\right\|_{\infty}^{p-1} \geq \lambda_{1}, \quad \text { for all } p>1
$$

where $\lambda_{1}=\lambda_{1}(\Omega)(>0)$ is the first eigenvalue of the operator $-\Delta$ in $H_{0}^{1}(\Omega)$.
(ii) (Existence of the first bubble).

Let $\left(x_{p}^{+}\right) \subset \Omega$ be such that $u_{p}\left(x_{p}^{+}\right)=\left\|u_{p}\right\|_{\infty}$. Let us set

$$
\begin{equation*}
\mu_{p}^{+}:=\left(p\left|u_{p}\left(x_{p}^{+}\right)\right|^{p-1}\right)^{-\frac{1}{2}} \tag{2.12}
\end{equation*}
$$

and for $x \in \widetilde{\Omega}_{p}^{+}:=\left\{x \in \mathbb{R}^{2}: x_{p}^{+}+\mu_{p}^{+} x \in \Omega\right\}$

$$
\begin{equation*}
v_{p}^{+}(x):=\frac{p}{u_{p}\left(x_{p}^{+}\right)}\left(u_{p}\left(x_{p}^{+}+\mu_{p}^{+} x\right)-u_{p}\left(x_{p}^{+}\right)\right) \tag{2.13}
\end{equation*}
$$

Then $\mu_{p}^{+} \rightarrow 0$ as $p \rightarrow+\infty$ and

$$
v_{p}^{+} \longrightarrow U \quad \text { in } C_{\mathrm{loc}}^{2}\left(\mathbb{R}^{2}\right) \text { as } p \rightarrow+\infty
$$

where

$$
\begin{equation*}
U(x)=\log \left(\frac{1}{1+\frac{1}{8}|x|^{2}}\right)^{2} \tag{2.14}
\end{equation*}
$$

## Asymptotic profile of positive solutions

is the solution of $-\Delta U=e^{U}$ in $\mathbb{R}^{2}, U \leq 0, U(0)=0$ and $\int_{\mathbb{R}^{2}} e^{U}=8 \pi$. Moreover,

$$
\begin{equation*}
\liminf _{p \rightarrow+\infty}\left\|u_{p}\right\|_{\infty} \geq 1 \tag{2.15}
\end{equation*}
$$

(iii) (No blow-up). There exists $C>0$ such that

$$
\begin{equation*}
\left\|u_{p}\right\|_{\infty} \leq C, \quad \text { for } p \text { sufficiently large. } \tag{2.16}
\end{equation*}
$$

(iv) There exist constants $c, C>0$, such that for all $p$ sufficiently large we have

$$
\begin{equation*}
c \leq p \int_{\Omega}\left|u_{p}(x)\right|^{p} \mathrm{~d} x \leq C \tag{2.17}
\end{equation*}
$$

(v) $\sqrt{p} u_{p} \rightharpoonup 0$ in $H_{0}^{1}(\Omega)$ as $p \rightarrow+\infty$.

Proof. The statements (i) and (iii) have been first proved for positive solutions in [12], while (ii) is essentially proved in [1] (see also [6]). Assertion (iv) follows easily from (iii), by Hölder inequality and (2.10) and (2.11). The proof of $(\mathrm{v})$ is given in [5] or [6].

We now recall an important result about the asymptotic behavior of solutions to (1.1) satisfying (1.2) which has been proved in [5]. It is the starting point for the proof of Theorem 1.1.

In order to state it (see Proposition 2.4 below) we need to introduce some notations. Given a family $\left(u_{p}\right)$ of solutions of (1.1) and assuming that there exists $n \in \mathbb{N} \backslash\{0\}$ families of points $\left(x_{i, p}\right), i=1, \ldots, n$ in $\Omega$ such that

$$
\begin{equation*}
p\left|u_{p}\left(x_{i, p}\right)\right|^{p-1} \rightarrow+\infty \quad \text { as } p \rightarrow+\infty \tag{2.18}
\end{equation*}
$$

we define the parameters $\mu_{i, p}$ by

$$
\begin{equation*}
\mu_{i, p}^{-2}=p\left|u_{p}\left(x_{i, p}\right)\right|^{p-1}, \quad \text { for all } i=1, \ldots, n \tag{2.19}
\end{equation*}
$$

By (2.18) it is clear that $\mu_{i, p} \rightarrow 0$ as $p \rightarrow+\infty$ and that

$$
\begin{equation*}
\liminf _{p \rightarrow+\infty}\left|u_{p}\left(x_{i, p}\right)\right| \geq 1 \tag{2.20}
\end{equation*}
$$

Then we define the concentration set

$$
\begin{equation*}
\mathcal{S}=\left\{\lim _{p \rightarrow+\infty} x_{i, p}, i=1, \ldots, n\right\} \subset \bar{\Omega} \tag{2.21}
\end{equation*}
$$

and the function

$$
\begin{equation*}
R_{n, p}(x)=\min _{i=1, \ldots, n}\left|x-x_{i, p}\right|, \quad \forall x \in \Omega \tag{2.22}
\end{equation*}
$$

Finally, we introduce the following properties:
$\left(\mathcal{P}_{1}^{n}\right)$ For any $i, j \in\{1, \ldots, n\}, i \neq j$,

$$
\lim _{p \rightarrow+\infty} \frac{\left|x_{i, p}-x_{j, p}\right|}{\mu_{i, p}}=+\infty
$$

$\left(\mathcal{P}_{2}^{n}\right)$ For any $i=1, \ldots, n$, for $x \in \widetilde{\Omega}_{i, p}:=\left\{x \in \mathbb{R}^{2}: x_{i, p}+\mu_{i, p} x \in \Omega\right\}$

$$
\begin{equation*}
v_{i, p}(x):=\frac{p}{u_{p}\left(x_{i, p}\right)}\left(u_{p}\left(x_{i, p}+\mu_{i, p} x\right)-u_{p}\left(x_{i, p}\right)\right) \longrightarrow U(x) \tag{2.23}
\end{equation*}
$$

in $C_{\text {loc }}^{2}\left(\mathbb{R}^{2}\right)$ as $p \rightarrow+\infty$, where $U$ is the same function in (2.14).
$\left(\mathcal{P}_{3}^{n}\right)$ There exists $C>0$ such that

$$
p R_{n, p}(x)^{2}\left|u_{p}(x)\right|^{p-1} \leq C
$$

for all $p>1$ and all $x \in \Omega$.
$\left(\mathcal{P}_{4}^{n}\right)$ There exists $C>0$ such that

$$
p R_{n, p}(x)\left|\nabla u_{p}(x)\right| \leq C
$$

for all $p>1$ and all $x \in \Omega$.
Lemma 2.3 [5, Lemma 2.1-(iii)]. If there exists $n \in \mathbb{N} \backslash\{0\}$ such that the properties $\left(\mathcal{P}_{1}^{n}\right)$ and $\left(\mathcal{P}_{2}^{n}\right)$ hold for families $\left(x_{i, p}\right)_{i=1, \ldots, n}$ of points satisfying (2.18), then

$$
p \int_{\Omega}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x \geq 8 \pi \sum_{i=1}^{n} \alpha_{i}^{2}+o_{p}(1) \quad \text { as } p \rightarrow+\infty
$$

where $\alpha_{i}:=\liminf _{p \rightarrow+\infty}\left|u_{p}\left(x_{i, p}\right)\right|(\stackrel{(2.20)}{\geq} 1)$.
Next result shows that the solutions concentrate at a finite number of points and also establish the existence of a maximal number of "bubbles".

Proposition 2.4 ([5, Proposition 2.2], [6, Theorem 2.3]). Let $\left(u_{p}\right)$ be a family of solutions to (1.1) and assume that (1.2) holds. Then there exist $k \in \mathbb{N} \backslash\{0\}$ and $k$ families of points $\left(x_{i, p}\right)$ in $\Omega, i=1, \ldots, k$ such that, after passing to a sequence, $\left(\mathcal{P}_{1}^{k}\right),\left(\mathcal{P}_{2}^{k}\right)$, and $\left(\mathcal{P}_{3}^{k}\right)$ hold. Moreover $x_{1, p}=x_{p}^{+}$and, given any family of points $x_{k+1, p}$, it is impossible to extract a new sequence from the previous one such that $\left(\mathcal{P}_{1}^{k+1}\right),\left(\mathcal{P}_{2}^{k+1}\right)$, and $\left(\mathcal{P}_{3}^{k+1}\right)$ hold with the sequences $\left(x_{i, p}\right), i=1, \ldots, k+1$. At last, we have

$$
\begin{equation*}
\sqrt{p} u_{p} \rightarrow 0 \quad \text { in } C_{\mathrm{loc}}^{2}(\bar{\Omega} \backslash \mathcal{S}) \text { as } p \rightarrow+\infty \tag{2.24}
\end{equation*}
$$

Moreover, there exists $v \in C^{2}(\bar{\Omega} \backslash \mathcal{S})$ such that

$$
\begin{equation*}
p u_{p} \rightarrow v \quad \text { in } C_{\mathrm{loc}}^{2}(\bar{\Omega} \backslash \mathcal{S}) \text { as } p \rightarrow+\infty \tag{2.25}
\end{equation*}
$$

and $\left(\mathcal{P}_{4}^{k}\right)$ holds.
In the rest of this section we derive some consequences of Proposition 2.4.
Remark 2.5. Under the assumptions of Proposition 2.4 we have

$$
\frac{\operatorname{dist}\left(x_{i, p}, \partial \Omega\right)}{\mu_{i, p}} \underset{p \rightarrow+\infty}{\longrightarrow}+\infty \quad \text { for all } i \in\{1, \ldots, k\}
$$

Corollary 2.6. Let $K \subset \bar{\Omega} \backslash \mathcal{S}$ be a compact set. Then

$$
\begin{equation*}
\lim _{p \rightarrow+\infty}\left\|p\left|u_{p}(x)\right|^{p}\right\|_{L^{\infty}(K)}=\lim _{p \rightarrow+\infty}\left\|p\left|u_{p}\right|^{p+1}\right\|_{L^{\infty}(K)}=0 \tag{2.26}
\end{equation*}
$$

and so

$$
\begin{equation*}
\lim _{p \rightarrow+\infty} p \int_{K}\left|u_{p}(x)\right|^{p} \mathrm{~d} x=\lim _{p \rightarrow+\infty} p \int_{K}\left|u_{p}(x)\right|^{p+1} \mathrm{~d} x=0 \tag{2.27}
\end{equation*}
$$

Moreover,

$$
\begin{equation*}
\lim _{p \rightarrow+\infty}\left\|p\left|\nabla u_{p}(x)\right|^{2}\right\|_{L^{\infty}(K)}=0 \tag{2.28}
\end{equation*}
$$

and so

$$
\begin{equation*}
\lim _{p \rightarrow+\infty} p \int_{K}\left|\nabla u_{p}(x)\right|^{2} \mathrm{~d} x=0 \tag{2.29}
\end{equation*}
$$

Proof. If $K$ is a compact subset of $\bar{\Omega} \backslash \mathcal{S}$ by $\left(\mathcal{P}_{3}^{k}\right)$ we have that there exists $C_{K}>0$ such that

$$
\begin{equation*}
p\left|u_{p}(x)\right|^{p-1} \leq C_{K}, \quad \text { for all } x \in K \tag{2.30}
\end{equation*}
$$

As a consequence for $x \in K$
$p\left|u_{p}(x)\right|^{p+1} \leq\left\|u_{p}\right\|_{\infty} p\left|u_{p}(x)\right|^{p} \stackrel{\text { Proposition 2.2-(iii) }}{\leq} C p\left|u_{p}(x)\right|^{p} \stackrel{(2.30)}{\leq} C_{K} u_{p}(x) \rightarrow 0$
uniformly as $p \rightarrow+\infty$ by (2.24).
The proof of (2.28) follows similarly by using $\left(\mathcal{P}_{4}^{k}\right)$ instead of $\left(\mathcal{P}_{3}^{k}\right)$.
For a family of points $\left(x_{p}\right) \subset \Omega$ we denote by $\mu\left(x_{p}\right)$ the numbers defined by

$$
\begin{equation*}
\left[\mu\left(x_{p}\right)\right]^{-2}:=p\left|u_{p}\left(x_{p}\right)\right|^{p-1} \tag{2.32}
\end{equation*}
$$

Proposition 2.7 [5, Proposition 2.5]. Let $\left(x_{p}\right) \subset \Omega$ be a family of points such that $p\left|u_{p}\left(x_{p}\right)\right|^{p-1} \rightarrow+\infty$ and let $\mu\left(x_{p}\right)$ be as in (2.32). Let $i \in\{1, \ldots, k\}$ such that $R_{k, p}\left(x_{p}\right)=\left|x_{i, p}-x_{p}\right|$, up to a sequence, then

$$
\limsup _{p \rightarrow+\infty} \frac{\mu_{i, p}}{\mu\left(x_{p}\right)} \leq 1
$$

Next result characterizes in different ways the concentration set $\mathcal{S}$.
Proposition 2.8 [6, Proposition 2.9]. Let $\left(u_{p}\right)$ be a family of solutions to (1.1) satisfying (1.2). Then the following holds:
$\mathcal{S}=\left\{x \in \bar{\Omega}: \forall r_{0}>0, \forall p_{0}>1, \exists p>p_{0}\right.$ s.t. $\left.p \int_{B_{r_{0}}(x) \cap \Omega}\left|u_{p}(x)\right|^{p+1} \mathrm{~d} x \geq 1\right\} ;$
(ii)
$\mathcal{S}=\left\{x \in \bar{\Omega}: \begin{array}{l}\exists \text { a sequence }\left(u_{p_{n}}\right) \subset\left(u_{p}\right) \text { and a sequence of points } x_{p_{n}} \rightarrow x, \\ \text { s.t. } p_{n}\left|u_{p_{n}}\left(x_{p_{n}}\right)\right| \rightarrow+\infty \text { as } p_{n} \rightarrow+\infty\end{array}\right\}$.

## 3. No concentration at the boundary

Let $k \in \mathbb{N} \backslash\{0\}$ be as in Proposition 2.4 the maximal number of families of points $\left(x_{i, p}\right) \subset \Omega, i=1, \ldots, k$ which up to a sequence satisfy $\left(\mathcal{P}_{1}^{k}\right)\left(\mathcal{P}_{2}^{k}\right)$ and $\left(\mathcal{P}_{3}^{k}\right)$. In (2.21) we have also defined

$$
\mathcal{S}=\left\{\lim _{p \rightarrow+\infty} x_{i, p}, i=1, \ldots, k\right\} \subset \bar{\Omega}
$$

for which the characterization in Proposition 2.8 holds.

## F. De Marchis et al.

We denote by $N \in \mathbb{N} \backslash\{0\}$ the number of points in $\mathcal{S}$. Hence $N \leq k$, moreover, without loss of generality we can relabel the sequences of points $x_{i, p}, i=1, \ldots, k$, and assume that

$$
\begin{equation*}
x_{j, p} \rightarrow x_{j}, \quad \forall j=1, \ldots, N \quad \text { and } \quad \mathcal{S}=\left\{x_{1}, x_{2}, \ldots, x_{N}\right\} \tag{3.1}
\end{equation*}
$$

Lemma 3.1. There exists $\gamma_{j}>0, j=1, \ldots, N$, such that

$$
\lim _{p \rightarrow+\infty} p u_{p}=\sum_{j=1}^{N} \gamma_{j} G\left(\cdot, x_{j}\right) \quad \text { in } C_{\mathrm{loc}}^{2}(\bar{\Omega} \backslash \mathcal{S})
$$

Moreover

$$
\begin{equation*}
\gamma_{j}=\lim _{\delta \rightarrow 0} \lim _{p \rightarrow+\infty} p \int_{B_{\delta}\left(x_{j}\right) \cap \Omega} u_{p}(x)^{p} \mathrm{~d} x \tag{3.2}
\end{equation*}
$$

where $B_{\delta}\left(x_{j}\right)$ is the ball of center at $x_{j}$ and radius $\delta>0$.
Proof. Since the $x_{j}$ 's are isolated, there exists $r>0$ such that $B_{r}\left(x_{i}\right) \cap$ $B_{r}\left(x_{j}\right)=\emptyset$. Let $\delta \in(0, r)$, then by the Green representation formula

$$
\begin{aligned}
& p u_{p}(x)= p \int_{\Omega} G(x, y) u_{p}(y)^{p} \mathrm{~d} y \\
&= p \sum_{j=1}^{N} \int_{B_{\delta}\left(x_{j}\right) \cap \Omega} G(x, y) u_{p}(y)^{p} \mathrm{~d} y \\
&+p \int_{\Omega \backslash \cup_{j} B_{\delta}\left(x_{j}\right)} G(x, y) u_{p}(y)^{p} \mathrm{~d} y \\
&(2.6)-(2.7)-(2.27) \\
&= \sum_{j=1}^{N} \int_{B_{\delta}\left(x_{j}\right) \cap \Omega} G(x, y) u_{p}(y)^{p} \mathrm{~d} y+o_{p}(1) .
\end{aligned}
$$

Furthermore, by the continuity of $G(x, \cdot)$ in $\bar{\Omega} \backslash\{x\}$ and by Proposition 2.2(iv) we obtain

$$
\lim _{p \rightarrow+\infty} p u_{p}(x)=\sum_{j=1}^{N} \gamma_{j} G\left(x, x_{j}\right)
$$

where

$$
\gamma_{j}=\lim _{\delta \rightarrow 0} \lim _{p \rightarrow+\infty} p \int_{B_{\delta}\left(x_{j}\right) \cap \Omega} u_{p}(x)^{p} \mathrm{~d} x
$$

Last we show that $\gamma_{j}>0$.
Since $x_{j, p} \rightarrow x_{j}$ as $p \rightarrow+\infty$ then $B_{\frac{\delta}{2}}\left(x_{j, p}\right) \subset B_{\delta}\left(x_{j}\right)$ for $p$ large and so, since $u_{p}>0$

$$
\begin{aligned}
p \int_{B_{\delta}\left(x_{j}\right) \cap \Omega} u_{p}(x)^{p} \mathrm{~d} x & \geq p \int_{B_{\frac{\delta}{2}}\left(x_{j, p}\right) \cap \Omega} u_{p}(x)^{p} \mathrm{~d} x \\
& =u_{p}\left(x_{j, p}\right) \int_{B_{\frac{\delta}{2 \mu_{j, p}}}(0) \cap \tilde{\Omega}_{j, p}}\left(1+\frac{v_{j, p}(x)}{p}\right)^{p} \mathrm{~d} x,
\end{aligned}
$$

where the last equality is obtained by scaling around $x_{j, p}$, where $v_{j, p}$ are defined in (2.23) and $\widetilde{\Omega}_{j, p}=\left\{x \in \mathbb{R}^{2}: x_{i, p}+\mu_{i, p} x \in \Omega\right\}$. Passing to the limit as $p \rightarrow+\infty$, since $B_{\frac{\delta}{2 \mu_{j, p}}}(0) \cap \widetilde{\Omega}_{j, p} \rightarrow \mathbb{R}^{2}$ and $\left(\mathcal{P}_{2}^{N}\right)$ holds, by Fatou's Lemma we get

$$
\lim _{p} p \int_{B_{\delta}\left(x_{j}\right) \cap \Omega} u_{p}(x)^{p} \mathrm{~d} x \geq \liminf _{p} u_{p}\left(x_{j, p}\right) \int_{\mathbb{R}^{2}} e^{U(x)} \mathrm{d} x \geq 8 \pi>0
$$

having used that $\liminf _{p} u_{p}\left(x_{j, p}\right) \geq 1($ see (2.20)) .
Next we show that there is no boundary blow-up:

## Proposition 3.2.

$$
\mathcal{S} \cap \partial \Omega=\emptyset
$$

Proof. We argue by contradiction. Suppose that $x_{i} \in \mathcal{S} \cap \partial \Omega$, for some $i=$ $\{1, \ldots, N\}$. Choose $r>0$ such that $\mathcal{S} \cap B_{r}\left(x_{i}\right)=\left\{x_{i}\right\}$. By the characterization of $\mathcal{S}$ in Proposition 2.8(i), we have that for all $\delta<r$, for all $p_{0}>1$ there exists $p>p_{0}$ such that

$$
\begin{equation*}
p \int_{\Omega \cap B_{\delta}\left(x_{i}\right)} u_{p}(x)^{p+1} \mathrm{~d} x \geq 1 \tag{3.3}
\end{equation*}
$$

Let $y_{p}:=x_{i}+\rho_{p, \delta} \nu\left(x_{i}\right)$, where

$$
\rho_{p, \delta}:=\frac{\int_{\partial \Omega \cap B_{\delta}\left(x_{i}\right)}\left(\frac{\partial u_{p}(x)}{\partial \nu}\right)^{2}\left\langle x-x_{i}, \nu(x)\right\rangle \mathrm{d} s_{x}}{\int_{\partial \Omega \cap B_{\delta}\left(x_{i}\right)}\left(\frac{\partial u_{p}(x)}{\partial \nu}\right)^{2}\left\langle\nu\left(x_{i}\right), \nu(x)\right\rangle \mathrm{d} s_{x}}
$$

and $\delta \ll r$ such that $\frac{1}{2} \leq\left\langle\nu\left(x_{i}\right), \nu(x)\right\rangle \leq 1$, for $x \in \partial \Omega \cap B_{\delta}\left(x_{i}\right)$. With this choice of $\delta$ we have

$$
\begin{equation*}
\left|\rho_{p, \delta}\right| \leq 2 \delta \tag{3.4}
\end{equation*}
$$

Moreover, it is easy to see that the choice of $y_{p}$ implies

$$
\begin{equation*}
\int_{\partial \Omega \cap B_{\delta}\left(x_{i}\right)}\left(\frac{\partial u_{p}(x)}{\partial \nu}\right)^{2}\left\langle x-y_{p}, \nu(x)\right\rangle \mathrm{d} s_{x}=0 . \tag{3.5}
\end{equation*}
$$

Applying the local Pohozaev identity (2.1) in the set $\Omega \cap B_{\delta}\left(x_{i}\right)$ with $y=y_{p}$, using (3.5), the boundary condition $u_{p}=0$ on $\partial \Omega$ (so that $\left|\frac{\partial u_{p}}{\partial \nu}\right|=\left|\nabla u_{p}\right|$ on $\partial \Omega)$ we obtain

$$
\begin{aligned}
\frac{2 p^{2}}{p+1} \int_{\Omega \cap B_{\delta}\left(x_{i}\right)} u_{p}(x)^{p+1} \mathrm{~d} x= & \frac{p^{2}}{2} \int_{\partial \Omega \cap B_{\delta}\left(x_{i}\right)}\left|\nabla u_{p}(x)\right|^{2}\left\langle x-y_{p}, \nu(x)\right\rangle \mathrm{d} s_{x} \\
& -\frac{1}{2} \int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)}\left|p \nabla u_{p}(x)\right|^{2}\left\langle x-y_{p}, \nu(x)\right\rangle \mathrm{d} s_{x} \\
& +\int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)}\left\langle x-y_{p}, p \nabla u_{p}(x)\right\rangle\left\langle p \nabla u_{p}(x), \nu(x)\right\rangle \mathrm{d} s_{x} \\
& +\frac{p^{2}}{(p+1)} \int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)} u_{p}(x)^{p+1}\left\langle x-y_{p}, \nu(x)\right\rangle \mathrm{d} s_{x} \\
\stackrel{(3.5)}{=} & -\frac{1}{2} \int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)}\left|p \nabla u_{p}(x)\right|^{2}\left\langle x-y_{p}, \nu(x)\right\rangle \mathrm{d} s_{x}
\end{aligned}
$$

F. De Marchis et al.

$$
\begin{align*}
& +\int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)}\left\langle x-y_{p}, p \nabla u_{p}(x)\right\rangle\left\langle p \nabla u_{p}(x), \nu(x)\right\rangle \mathrm{d} s_{x} \\
& +\frac{p^{2}}{(p+1)} \int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)} u_{p}(x)^{p+1}\left\langle x-y_{p}, \nu(x)\right\rangle \mathrm{d} s_{x} . \tag{3.6}
\end{align*}
$$

Next we show that the three terms in the right-hand side are $O\left(\delta^{2}\right)$.
By Lemma 3.1 we have in particular that $p u_{p} \rightarrow \sum_{j=1}^{N} \gamma_{j} G\left(\cdot, x_{j}\right)$ in $C_{\text {loc }}^{2}\left(\bar{\Omega} \cap B_{r}\left(x_{i}\right) \backslash\left\{x_{i}\right\}\right)$. Hence it is easy to see that for $x \in \bar{\Omega} \cap B_{r}\left(x_{i}\right) \backslash\left\{x_{i}\right\}$, since $x_{i} \in \partial \Omega$ :

$$
\begin{align*}
\sum_{j=1}^{N} \gamma_{j} G\left(x, x_{j}\right) & =\gamma_{i} G\left(x, x_{i}\right)+O(1) \stackrel{(2.2)}{=} O(1) ; \\
\sum_{j=1}^{N} \gamma_{j} \nabla_{x} G\left(x, x_{j}\right) & =\gamma_{i} \nabla_{x} G\left(x, x_{i}\right)+O(1) \\
G & \left.\stackrel{\text { is symm }}{=} \gamma_{i} \nabla_{y} G(x, y)\right|_{y=x_{i}}+O(1) \\
G \equiv 0 \text { on } \partial \Omega & \gamma_{i} \frac{\partial G\left(x, x_{i}\right)}{\partial \nu}+O(1) \stackrel{(2.8)}{=} O(1) . \tag{3.7}
\end{align*}
$$

So, by the uniform convergence of $p u_{p}$ and its derivative on compact sets, it follows that

$$
\begin{aligned}
& -\frac{1}{2} \int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)}\left|p \nabla u_{p}(x)\right|^{2}\left\langle x-y_{p}, \nu(x)\right\rangle \mathrm{d} s_{x} \\
& \stackrel{(3.7)}{=} O(1) \int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)}\left\langle x-y_{p}, \nu(x)\right\rangle \mathrm{d} s_{x}=O\left(\delta^{2}\right) ; \\
& \int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)}\left\langle x-y_{p}, p \nabla u_{p}(x)\right\rangle\left\langle p \nabla u_{p}(x), \nu(x)\right\rangle \mathrm{d} s_{x} \\
& \stackrel{(3.7)}{=} O(1) \int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)}\left|x-y_{p}\right| \mathrm{d} s_{x}=O\left(\delta^{2}\right) ; \\
& \frac{p^{2}}{p+1}\left|\int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)} u_{p}(x)^{p+1}\left\langle x-y_{p}, \nu(x)\right\rangle \mathrm{d} s_{x}\right| \\
& \leq \frac{p}{p+1}\left\|p u_{p}^{p+1}\right\|_{L^{\infty}\left(\bar{\Omega} \cap \partial B_{\delta}\left(x_{i}\right)\right)} \int_{\Omega \cap \partial B_{\delta}\left(x_{i}\right)}\left|\left\langle x-y_{p}, \nu(x)\right\rangle\right| \mathrm{d} s_{x} \\
& \stackrel{(2.26)}{=} o_{p}(1) O\left(\delta^{2}\right) ;
\end{aligned}
$$

where in all the three cases for the last equality we have also used the estimate in (3.4). As a consequence, by (3.6),

$$
\lim _{\delta \rightarrow 0} \lim _{p \rightarrow+\infty} \frac{p^{2}}{p+1} \int_{\Omega \cap B_{\delta}\left(x_{i}\right)} u_{p}(x)^{p+1} \mathrm{~d} x=0
$$

a contradiction to (3.3).

## 4. Scaling around local maxima

By Proposition 3.2 it follows that there exists $r>0$ such that

$$
\begin{equation*}
B_{4 r}\left(x_{i}\right) \cap B_{4 r}\left(x_{j}\right)=\emptyset, B_{4 r}\left(x_{i}\right) \subset \Omega, \text { for all } i=1, \ldots, N, i \neq j . \tag{4.1}
\end{equation*}
$$

Lemma 4.1. Let $N \in \mathbb{N} \backslash\{0\}$ be as in (3.1) and let $r>0$ be as in (4.1). Let us define $y_{j, p} \in \overline{B_{2 r}\left(x_{j}\right)}, j=1, \ldots, N$ such that

$$
\begin{equation*}
u_{p}\left(y_{j, p}\right)=\frac{\max }{B_{2 r}\left(x_{j}\right)} u_{p}(x) \tag{4.2}
\end{equation*}
$$

Then, for any $j=1, \ldots, N$ and as $p \rightarrow+\infty$ :
(i)

$$
\varepsilon_{j, p}:=\left[p u_{p}\left(y_{j, p}\right)^{p-1}\right]^{-1 / 2} \rightarrow 0
$$

(ii)

$$
y_{j, p} \rightarrow x_{j} .
$$

(iii)

$$
\frac{\left|y_{i, p}-y_{j, p}\right|}{\varepsilon_{j, p}} \rightarrow+\infty \quad \text { for any } i=1, \ldots, N, i \neq j
$$

(iv) Defining:

$$
\begin{equation*}
w_{j, p}(y):=\frac{p}{u_{p}\left(y_{j, p}\right)}\left(u_{p}\left(y_{j, p}+\varepsilon_{j, p} y\right)-u_{p}\left(y_{j, p}\right)\right), \quad y \in \Omega_{j, p}:=\frac{\Omega-y_{j, p}}{\varepsilon_{j, p}} \tag{4.3}
\end{equation*}
$$

then

$$
\begin{equation*}
w_{j, p} \longrightarrow U \quad \text { in } C_{\mathrm{loc}}^{2}\left(\mathbb{R}^{2}\right) \tag{4.4}
\end{equation*}
$$

with $U$ as in (2.14).
(v)

$$
\begin{equation*}
\underset{p}{\liminf } p \int_{B_{r}\left(x_{j}\right)} u_{p}(x)^{p+1} \mathrm{~d} x \geq 8 \pi \cdot \lim _{p} \inf u_{p}\left(y_{j, p}\right)^{2}(>8 \pi) \tag{4.5}
\end{equation*}
$$

$$
\begin{equation*}
\liminf _{p} p \int_{B_{r}\left(y_{j, p}\right)} u_{p}(x)^{p} \mathrm{~d} x \geq 8 \pi \cdot \liminf _{p} u_{p}\left(y_{j, p}\right) \tag{vi}
\end{equation*}
$$

Remark 4.2. (iii) and (iv) are, respectively, properties $\left(\mathcal{P}_{1}^{N}\right)$ and $\left(\mathcal{P}_{2}^{N}\right)$ for the families of points $y_{j, p}, j=1, \ldots, N$. Moreover, by (i) we get

$$
\begin{equation*}
\liminf _{p \rightarrow+\infty} u_{p}\left(y_{j, p}\right) \geq 1 \tag{4.6}
\end{equation*}
$$

and by (ii) we deduce that for any $\delta \in(0,2 r)$ there exists $p_{\delta}>1$ such that

$$
\begin{equation*}
y_{j, p} \in B_{\delta}\left(x_{j}\right), \quad \text { for } p \geq p_{\delta} \tag{4.7}
\end{equation*}
$$

Proof. (i) Let $j \in\{1, \ldots, N\}$, by (3.1) $x_{j, p} \rightarrow x_{j}$ as $p \rightarrow+\infty$ and so $x_{j, p} \in B_{r}\left(x_{j}\right)$ for $p$ large. The assertion then follows observing that by definition $u_{p}\left(y_{j, p}\right) \geq u_{p}\left(x_{j, p}\right)$ and that (2.18) holds for $x_{j, p}$.

## F. De Marchis et al.

(ii) We know that $x_{j, p} \rightarrow x_{j}$ as $p \rightarrow+\infty$, so without loss of generality we may assume that $R_{k, p}\left(y_{j, p}\right)=\left|x_{j, p}-y_{j, p}\right|$ and so $\left(\mathcal{P}_{3}^{k}\right)$ may be written as $\frac{\left|x_{j, p}-y_{j, p}\right|}{\varepsilon_{j, p}} \leq C$, from which by (i) the conclusion follows.
(iii) Just observing that by construction $\left|y_{i, p}-y_{j, p}\right| \geq 6 r$ if $i \neq j$.
(iv) First we prove that for any $R>0$ there exists $p_{R}>1$ such that

$$
\begin{equation*}
B_{R}(0) \subset B_{\frac{2 r}{}}^{\varepsilon_{j, p}}\left(\frac{x_{j}-y_{j, p}}{\varepsilon_{j, p}}\right) \subset \Omega_{j, p} \quad \text { for } p \geq p_{R} \tag{4.8}
\end{equation*}
$$

Indeed using (ii) and (i) we get, respectively, that $y_{j, p} \in B_{r}\left(x_{j}\right)$ and $R \varepsilon_{j, p}<r$ for $p$ large. As a consequence $B_{R \varepsilon_{j, p}}\left(y_{j, p}\right) \subset B_{2 r}\left(x_{j}\right) \subset \Omega$ for $p$ large, which gives (4.8) by scaling back.

Observe that by (4.8) and the arbitrariness of $R$ it follows that the set $\Omega_{j, p} \rightarrow \mathbb{R}^{2}$ as $p \rightarrow+\infty$.

Moreover, let us fix $R>0$ and let $p_{R}$ be as in (4.8); then for $p \geq p_{R}$ the function $w_{j, p}$ satisfies

$$
\left\{\begin{array}{l}
-\Delta w_{j, p}(y)=\left(\frac{u_{p}\left(y_{j, p}+\varepsilon_{j, p} y\right)}{u_{p}\left(y_{j, p}\right)}\right)^{p}, \quad y \in B_{R}(0) \\
w_{j, p}(0)=0
\end{array}\right.
$$

and by the first inclusion in (4.8) and the definition of $y_{j, p}$ we have

$$
u_{p}\left(y_{j, p}+\varepsilon_{j, p} y\right) \leq u_{p}\left(y_{j, p}\right), \quad \text { for any } y \in B_{R}(0), \text { for } p \geq p_{R}
$$

This implies both

$$
\begin{equation*}
w_{j, p}(y) \leq 0, \quad y \in B_{R}(0) \tag{4.9}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|-\Delta w_{j, p}(y)\right| \leq 1, \quad y \in B_{R}(0) \tag{4.10}
\end{equation*}
$$

for $p \geq p_{R}$. From (4.9) and (4.10), arguing as in the proof of Proposition 2.4, it follows that, for any $R>0, w_{j, p}$ is uniformly bounded in $B_{R}(0)$, for $p \geq p_{R}$. By standard elliptic regularity theory we have that $w_{j, p}$ is bounded in $C_{\text {loc }}^{2, \alpha}\left(\mathbb{R}^{2}\right)$. Thus by Arzela-Ascoli Theorem and a diagonal process on $R \rightarrow$ $+\infty$, after passing to a subsequence, $w_{j, p} \rightarrow_{p} v$ in $C_{\text {loc }}^{2}\left(\mathbb{R}^{2}\right)$ and it is easy to see that $v$ satisfies

$$
\begin{cases}-\Delta v=e^{v} & \text { in } \mathbb{R}^{2} \\ v \leq 0 & \text { in } \mathbb{R}^{2} \\ v(0)=0 & \\ \int_{\mathbb{R}^{2}} e^{v}<\infty ; & \end{cases}
$$

hence $v=U$ where $U$ is the function in (2.14).
(v) and (vi) Using (4.7) we have that $y_{j, p} \in B_{\frac{r}{2}}\left(x_{j}\right)$ for large $p$ and so $B_{\frac{r}{2}}\left(y_{j, p}\right) \subset B_{r}\left(x_{j}\right) \subset \Omega$ for $p$ large, namely, by scaling

$$
\begin{equation*}
B_{\frac{r}{2 \varepsilon_{j, p}}}(0) \subset \Omega_{j, p}, \quad \text { for } p \text { large } \tag{4.11}
\end{equation*}
$$

## Asymptotic profile of positive solutions

and

$$
\begin{aligned}
p \int_{B_{r}\left(x_{j}\right)} u_{p}(x)^{p+1} \mathrm{~d} x & \geq p \int_{B_{\frac{r}{2}}\left(y_{j, p}\right)} u_{p}(x)^{p+1} \mathrm{~d} x \\
& =u_{p}\left(y_{j, p}\right)^{2} \int_{B_{\frac{r}{2 \varepsilon_{j, p}}}(0)}\left(1+\frac{w_{j, p}(y)}{p}\right)^{p+1} \mathrm{~d} y
\end{aligned}
$$

Passing to the limit as $p \rightarrow+\infty$, by (i), (iv) and Fatou's Lemma

$$
\begin{aligned}
\liminf _{p} p \int_{B_{r}\left(x_{j}\right)} u_{p}(x)^{p+1} \mathrm{~d} x & \geq \liminf _{p} p \int_{B_{\frac{r}{2}}\left(y_{j, p}\right)} u_{p}(x)^{p+1} \mathrm{~d} x \\
& \geq \liminf _{p} u_{p}\left(y_{j, p}\right)^{2} \int_{\mathbb{R}^{2}} e^{U(y)} \mathrm{d} y \\
& =8 \pi \cdot \liminf _{p} u_{p}\left(y_{j, p}\right)^{2}
\end{aligned}
$$

which gives (v); moreover, by the previous relation

$$
\begin{aligned}
\liminf _{p} u_{p}\left(y_{j, p}\right) p \int_{B_{r}\left(y_{j, p}\right)} u_{p}(x)^{p} \mathrm{~d} x & \stackrel{(4.7)}{\geq} \liminf _{p} p \int_{B_{r}\left(y_{j, p}\right)} u_{p}(x)^{p+1} \mathrm{~d} x \\
& \geq \liminf _{p} p \int_{B_{\frac{r}{2}}\left(y_{j, p}\right)} u_{p}(x)^{p+1} \mathrm{~d} x \\
& \geq 8 \pi \cdot \liminf _{p} u_{p}\left(y_{j, p}\right)^{2}
\end{aligned}
$$

Proposition 4.3. Let $r>0$ be as in (4.1) and define, for $j=1, \ldots, N$ :

$$
\begin{equation*}
\beta_{j, p}:=\frac{p}{u_{p}\left(y_{j, p}\right)} \int_{B_{r}\left(y_{j, p}\right)} u_{p}(x)^{p} \mathrm{~d} x . \tag{4.12}
\end{equation*}
$$

Then,

$$
\begin{equation*}
\lim _{p \rightarrow+\infty} \beta_{j, p}=8 \pi \tag{4.13}
\end{equation*}
$$

Proof. Fix $j \in\{1, \ldots, N\}$. By Lemma 4.1(vi) we already know that

$$
\lim _{p \rightarrow+\infty} \beta_{j, p} \geq 8 \pi
$$

so we have to prove only the opposite inequality:

$$
\begin{equation*}
\lim _{p \rightarrow+\infty} \beta_{j, p} \leq 8 \pi \tag{4.14}
\end{equation*}
$$

For $\delta \in(0, r)$, by (4.1)

$$
\begin{equation*}
B_{\delta}\left(x_{j}\right) \subset \Omega, \tag{4.15}
\end{equation*}
$$

and we define

$$
\begin{equation*}
\alpha_{j, p}(\delta):=\frac{p}{u_{p}\left(y_{j, p}\right)} \int_{B_{\delta}\left(x_{j}\right)} u_{p}(x)^{p} \mathrm{~d} x . \tag{4.16}
\end{equation*}
$$

In order to prove (4.14) it is sufficient to show that

$$
\begin{equation*}
\lim _{\delta \rightarrow 0} \lim _{p \rightarrow+\infty} \alpha_{j, p}(\delta) \leq 8 \pi \tag{4.17}
\end{equation*}
$$

## F. De Marchis et al.

Indeed (4.14) follows from (4.17) and observing that

$$
\begin{equation*}
\beta_{j, p}=\alpha_{j, p}(\delta)+\frac{p}{u_{p}\left(y_{j, p}\right)} \int_{B_{r}\left(y_{j, p}\right) \backslash B_{\delta}\left(x_{j}\right)} u_{p}(x)^{p} \mathrm{~d} x=\alpha_{j, p}(\delta)+o_{p}(1) \tag{4.18}
\end{equation*}
$$

(4.18) can be proved observing that $y_{j, p} \in \overline{B_{2 r}\left(x_{j}\right)}$, then $B_{r}\left(y_{j, p}\right) \backslash B_{\delta}\left(x_{j}\right) \subset$ $B_{3 r}\left(x_{j}\right) \backslash B_{\delta}\left(x_{j}\right) \subset \bar{\Omega} \backslash \mathcal{S}$ and we know that for any compact subset of $\bar{\Omega} \backslash \mathcal{S}$ the limit (2.27) holds and $\liminf _{p} u_{p}\left(y_{j, p}\right) \geq 1$ by (4.6).
In the rest of the proof we show (4.17).
By Lemma 3.1 we have that $p u_{p} \rightarrow \sum_{j=1}^{N} \gamma_{j} G\left(\cdot, x_{j}\right)$ in $C_{\mathrm{loc}}^{2}\left(B_{r}\left(x_{i}\right) \backslash\left\{x_{i}\right\}\right)$. Moreover, it is easy to see that for $x \in B_{r}\left(x_{i}\right) \backslash\left\{x_{i}\right\}$

$$
\begin{align*}
& \sum_{j=1}^{N} \gamma_{j} G\left(x, x_{j}\right)=\gamma_{i} G\left(x, x_{i}\right)+O(1) \\
& \sum_{j=1}^{N} \gamma_{j} \nabla G\left(x, x_{j}\right)=\gamma_{i} \nabla G\left(x, x_{i}\right)+O(1) \tag{4.19}
\end{align*}
$$

Furthermore, $G\left(x, x_{i}\right)=\frac{1}{2 \pi} \log \frac{1}{\left|x-x_{i}\right|}+H\left(x, x_{i}\right)$ by (2.3), so that, by the regularity of $H$, if $\delta \in(0, r)$ is small enough and $x \in \overline{B_{\delta}\left(x_{i}\right)} \backslash\left\{x_{i}\right\}$, then

$$
\begin{align*}
& G\left(x, x_{i}\right)=\frac{1}{2 \pi} \log \frac{1}{\left|x-x_{i}\right|}+O(1) \\
& \nabla G\left(x, x_{i}\right)=-\frac{1}{2 \pi} \frac{x-x_{i}}{\left|x-x_{i}\right|^{2}}+O(1) \tag{4.20}
\end{align*}
$$

Applying the local Pohozaev identity (2.1) in the set $B_{\delta}\left(x_{i}\right)$ with $y=x_{i}$ we obtain (observe that if $\nu(x)$ is the outer unitary normal vector to $\partial B_{\delta}\left(x_{i}\right)$ in $x$ then $\left.\left\langle x-x_{i}, \nu(x)\right\rangle=\left|x-x_{i}\right|=\delta\right)$

$$
\begin{align*}
\frac{2 p^{2}}{p+1} \int_{B_{\delta}\left(x_{i}\right)} u_{p}(x)^{p+1} \mathrm{~d} x= & -\frac{\delta}{2} \int_{\partial B_{\delta}\left(x_{i}\right)}\left|p \nabla u_{p}(x)\right|^{2} \mathrm{~d} s_{x} \\
& +\delta \int_{\partial B_{\delta}\left(x_{i}\right)}\left\langle p \nabla u_{p}(x), \nu(x)\right\rangle^{2} \mathrm{~d} s_{x} \\
& +\frac{p^{2}}{p+1} \delta \int_{\partial B_{\delta}\left(x_{i}\right)} u_{p}(x)^{p+1} \mathrm{~d} s_{x} \tag{4.21}
\end{align*}
$$

Next we analyze the behavior of the three terms in the right-hand side of (4.1).

By the uniform convergence of the derivative of $p u_{p}$ on compact sets combined with (4.19) and (4.20), passing to the limit we have

$$
\begin{aligned}
&-\frac{\delta}{2} \int_{\partial B_{\delta}\left(x_{i}\right)}\left|p \nabla u_{p}(x)\right|^{2} \mathrm{~d} s_{x} \\
& \underset{p \rightarrow+\infty}{\longrightarrow}-\frac{\delta}{2} \int_{\partial B_{\delta}\left(x_{i}\right)}\left(-\gamma_{i} \frac{1}{2 \pi} \frac{x-x_{i}}{\left|x-x_{i}\right|^{2}}+O(1)\right)^{2} \mathrm{~d} s_{x}=-\frac{\gamma_{i}^{2}}{4 \pi}+O(\delta) ; \\
& \delta \int_{\partial B_{\delta}\left(x_{i}\right)}\left\langle p \nabla u_{p}(x), \nu(x)\right\rangle^{2} \mathrm{~d} s_{x} \\
& \underset{p \rightarrow+\infty}{\longrightarrow} \delta \int_{\partial B_{\delta}\left(x_{i}\right)}\left(-\gamma_{i} \frac{1}{2 \pi} \frac{\left\langle x-x_{i}, \nu(x)\right\rangle}{\left|x-x_{i}\right|^{2}}+O(1)\right)^{2} \mathrm{~d} s_{x}=\frac{\gamma_{i}^{2}}{2 \pi}+O(\delta)
\end{aligned}
$$

and also
$\frac{p^{2}}{p+1} \delta \int_{\partial B_{\delta}\left(x_{i}\right)} u_{p}(x)^{p+1} \mathrm{~d} s_{x} \leq \frac{2 \pi p}{p+1} \delta^{2}\left\|p u_{p}^{p+1}\right\|_{L^{\infty}\left(\partial B_{\delta}\left(x_{i}\right)\right)} \stackrel{(2.26)}{=} o_{p}(1) O\left(\delta^{2}\right)$.
So by (4.21) and recalling the definition of $\alpha_{j, p}$

$$
\begin{align*}
\alpha_{j, p}(\delta) u_{p}\left(y_{j, p}\right)^{2} & \stackrel{(4.16)}{=} u_{p}\left(y_{j, p}\right) p \int_{B_{\delta}\left(x_{j}\right)} u_{p}(x)^{p} \mathrm{~d} x \\
& \geq p \int_{B_{\delta}\left(x_{j}\right)} u_{p}(x)^{p+1} \mathrm{~d} x \stackrel{(4.21)}{=} \frac{\gamma_{j}^{2}}{8 \pi}+O(\delta)+o_{p}(1) \tag{4.22}
\end{align*}
$$

but

$$
\begin{equation*}
\gamma_{j} \stackrel{(3.2)-(4.15)}{=} \lim _{\delta \rightarrow 0} \lim _{p \rightarrow+\infty} p \int_{B_{\delta}\left(x_{j}\right)} u(x)^{p} \mathrm{~d} x \stackrel{(4.16)}{=} \lim _{\delta \rightarrow 0} \lim _{p \rightarrow+\infty} \alpha_{j, p}(\delta) u_{p}\left(y_{j, p}\right) \tag{4.23}
\end{equation*}
$$

Combining (4.22) and (4.23) we get (4.17).
We conclude this section by deriving a decay estimate for the rescaled function $w_{j, p}(y)$ defined in (4.3) for $y \in \Omega_{j, p}$, for any $j=1, \ldots, N$.
First recall that for any $R>0$ there exists $p_{R}>1$ such that

$$
\begin{equation*}
B_{R}(0) \subset B_{\frac{r}{\varepsilon_{j, p}}}(0) \subset B_{\frac{2 r}{}}^{\varepsilon_{j, p}}\left(\frac{x_{j}-y_{j, p}}{\varepsilon_{j, p}}\right) \subset \Omega_{j, p} \quad \text { for } p \geq p_{R} \tag{4.24}
\end{equation*}
$$

(indeed using (4.7) we have that $y_{j, p} \in B_{r}\left(x_{j}\right)$ and so $B_{r}\left(y_{j, p}\right) \subset B_{2 r}\left(x_{j}\right) \subset \Omega$ for $p$ large). Then by definition, for $p \geq p_{R}$

$$
\begin{equation*}
0 \leq\left(1+\frac{w_{j, p}(z)}{p}\right) \leq 1, \quad \text { for any } z \in B \frac{2 r}{\varepsilon_{j, p}}\left(\frac{x_{j}-y_{j, p}}{\varepsilon_{j, p}}\right) \tag{4.25}
\end{equation*}
$$

Moreover, observe that $\beta_{j, p}$ defined in (4.12) can be now rewritten as

$$
\begin{equation*}
\beta_{j, p}=\int_{B \frac{r}{\varepsilon_{j, p}}(0)}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z, \text { for } p \geq p_{R} \tag{4.26}
\end{equation*}
$$

## F. De Marchis et al.

Last, we recall that by Proposition 2.2(iv) and (4.6) we have that

$$
\begin{equation*}
\int_{\Omega_{j, p}}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z=\frac{p}{u_{p}\left(y_{j, p}\right)} \int_{\Omega} u_{p}(x)^{p} \mathrm{~d} x=O(1) . \tag{4.27}
\end{equation*}
$$

Lemma 4.4. For any $\varepsilon>0$, there exist $R_{\varepsilon}>1$ and $p_{\varepsilon}>1$ such that

$$
\begin{equation*}
w_{j, p}(y) \leq\left(\frac{\beta_{j, p}}{2 \pi}-\varepsilon\right) \log \frac{1}{|y|}+C_{\varepsilon}, \quad \forall j=1, \ldots, N \tag{4.28}
\end{equation*}
$$

for some $C_{\varepsilon}>0$ and $\beta_{j, p}$ as in Proposition 4.3, provided $2 R_{\varepsilon} \leq|y| \leq \frac{r}{\varepsilon_{j, p}}$ and $p \geq p_{\varepsilon}$.

Proof. Given $\varepsilon>0$, we can choose $R_{\varepsilon}>1$ such that

$$
\int_{B_{R_{\varepsilon}}(0)} e^{U(z)} \mathrm{d} z>8 \pi-\varepsilon
$$

The function $w_{j, p}$ is well defined in $B_{R_{\varepsilon}}(0)$ for $p$ large by (4.24), moreover by Fatou's lemma and (4.4)

$$
\liminf _{p \rightarrow+\infty} \int_{B_{R_{\varepsilon}}(0)}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \geq \int_{B_{R_{\varepsilon}}(0)} e^{U(z)} \mathrm{d} z
$$

namely for $p_{\varepsilon}>1$ sufficiently large

$$
\begin{equation*}
\int_{B_{R_{\varepsilon}}(0)}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z>8 \pi-\varepsilon \quad \text { for all } p \geq p_{\varepsilon} \tag{4.29}
\end{equation*}
$$

Let $2 R_{\varepsilon} \leq|y| \leq \frac{r}{\varepsilon_{j, p}}$. Observe that when $|z| \geq \frac{2 r}{\varepsilon_{j, p}}$ then $2|y| \leq|z|$; hence

$$
\frac{2}{3}=\frac{|z|}{|z|+\frac{|z|}{2}} \leq \frac{|z|}{|z|+|y|} \leq \frac{|z|}{|y-z|} \leq \frac{|z|}{|z|-|y|} \leq \frac{|z|}{|z|-\frac{|z|}{2}}=2
$$

which implies

$$
\begin{equation*}
\log \frac{2}{3} \leq \log \frac{|z|}{|y-z|} \leq \log 2 \tag{4.30}
\end{equation*}
$$

and so

$$
\begin{align*}
& \int_{\left\{|z| \geq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap \Omega_{j, p}} \log \frac{|z|}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& \stackrel{(4.30)}{=} O(1) \int_{\Omega_{j, p}}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \stackrel{(4.27)}{=} O(1) . \tag{4.31}
\end{align*}
$$

By (1.1) and the Green's function representation we have that for any $y \in$ $\Omega_{j, p}$

$$
\begin{aligned}
u_{p}\left(\varepsilon_{j, p} y+y_{j, p}\right) & =\int_{\Omega} G\left(\varepsilon_{j, p} y+y_{j, p}, x\right) u_{p}(x)^{p} \mathrm{~d} x \\
& =\varepsilon_{j, p}^{2} \int_{\Omega_{j, p}} G\left(\varepsilon_{j, p} y+y_{j, p}, \varepsilon_{j, p} z+y_{j, p}\right) u_{p}\left(\varepsilon_{j, p} z+y_{j, p}\right)^{p} \mathrm{~d} z \\
& =\frac{u_{p}\left(y_{j, p}\right)}{p} \int_{\Omega_{j, p}} G\left(\varepsilon_{j, p} y+y_{j, p}, \varepsilon_{j, p} z+y_{j, p}\right)\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z,
\end{aligned}
$$

## Asymptotic profile of positive solutions

namely

$$
\begin{equation*}
w_{j, p}(y)=-p+\int_{\Omega_{j, p}} G\left(\varepsilon_{j, p} y+y_{j, p}, \varepsilon_{j, p} z+y_{j, p}\right)\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \tag{4.32}
\end{equation*}
$$

As a consequence

$$
\begin{align*}
& w_{j, p}(y)= w_{j, p}(y)-w_{j, p}(0) \\
& \stackrel{(4.32)}{=} \int_{\Omega_{j, p}}\left[G\left(\varepsilon_{j, p} y+y_{j, p}, \varepsilon_{j, p} z+y_{j, p}\right)-G\left(y_{j, p}, \varepsilon_{j, p} z+y_{j, p}\right)\right] \\
& \times\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& \stackrel{(2.3)}{=} \frac{1}{2 \pi} \int_{\Omega_{j, p}} \log \frac{|z|}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
&+\int_{\Omega_{j, p}}\left[H\left(\varepsilon_{j, p} y+y_{j, p}, \varepsilon_{j, p} z+y_{j, p}\right)-H\left(y_{j, p}, \varepsilon_{j, p} z+y_{j, p}\right)\right] \\
& \times\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& \stackrel{(4.27)}{=} \frac{1}{2 \pi} \int_{\Omega_{j, p}} \log \frac{|z|}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z+O(1) \\
& \stackrel{(4.31)}{=}\left.\frac{1}{2 \pi} \int_{\left\{|z| \leq \frac{2 r}{}\right.}^{\varepsilon_{j, p}}\right\}  \tag{4.33}\\
& \log \frac{|z|}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z+O(1),
\end{align*}
$$

since $H$ is Lipschitz continuous and $\left|\varepsilon_{j, p} y\right| \leq r$. Next, let us divide the last integral of (4.33) in the following way:

$$
\begin{align*}
w_{j, p}(y) \stackrel{(4.33)}{=} & \frac{1}{2 \pi} \int_{\left\{|z| \leq R_{\varepsilon}\right\}} \log \frac{|z|}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& +\frac{1}{2 \pi} \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{|z| \leq 2|y-z|\}} \log \frac{|z|}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& +\frac{1}{2 \pi} \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{|z| \geq 2|y-z|\}} \log |z|\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& +\frac{1}{2 \pi} \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{|z| \geq 2|y-z|\}} \log \frac{1}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& +O(1) \\
= & \mathrm{I}+\mathrm{II}+\mathrm{III}+\mathrm{IV}+O(1) \tag{4.34}
\end{align*}
$$

In order to estimate the first integral in the right-hand side of (4.34) we observe that if $|z| \leq R_{\varepsilon}$, then $2|z| \leq|y|$ and so

$$
\frac{|z|}{|y-z|} \leq \frac{|z|}{|y|-|z|} \leq \frac{|z|}{|y|-\frac{|y|}{2}} \leq \frac{2 R_{\varepsilon}}{|y|}
$$

F. De Marchis et al.
therefore,

$$
\begin{align*}
I & =\frac{1}{2 \pi} \int_{\left\{|z| \leq R_{\varepsilon}\right\}} \log \frac{|z|}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& \leq \frac{1}{2 \pi} \log \frac{2 R_{\varepsilon}}{|y|} \int_{\left\{|z| \leq R_{\varepsilon}\right\}}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z . \tag{4.35}
\end{align*}
$$

Next, the second term in (4.34) can be trivially estimated as

$$
\begin{align*}
& \mathrm{II}= \frac{1}{2 \pi} \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{|z| \leq 2|y-z|\}} \log \frac{|z|}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& \leq \frac{1}{2 \pi} \log 2 \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{|z| \leq 2|y-z|\}}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& \begin{array}{l}
(4.26) \\
\leq \\
2 \pi \\
\\
\\
\\
\\
\left.+\int_{\left\{\frac{r}{\varepsilon_{j, p}} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\}}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z\right] \\
(4.6) \\
\leq \\
\frac{1}{2 \pi} \log 2\left[\beta_{j, p}-\int_{B_{R_{\varepsilon}}(0)}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z\right. \\
\\
\\
+
\end{array} \int_{\left\{r \leq\left|x-y_{j, p}\right| \leq 2 r\right\}}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& \leq \frac{1}{2 \pi} \log 2\left[\beta_{j, p}-\int_{B_{R_{\varepsilon}}(0)}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z+\varepsilon\right]
\end{align*}
$$

where in the last inequality we have used that since $y_{j, p} \rightarrow x_{j}$, then for $p$ large $\left\{r \leq\left|x-y_{j, p}\right| \leq 2 r\right\} \subset K:=\left\{\frac{r}{2} \leq\left|x-x_{j}\right| \leq 3 r\right\} \subset \bar{\Omega} \backslash \mathcal{S}$ and compact and so

$$
\begin{equation*}
p \int_{r \leq\left|x-y_{j, p}\right| \leq 2 r} u_{p}(x)^{p} \mathrm{~d} x \leq p \int_{K} u_{p}(x)^{p} \mathrm{~d} x \stackrel{(2.27)}{\leq} \varepsilon, \quad \text { for large } p \tag{4.37}
\end{equation*}
$$

To deal with the third integral in the right-hand side of (4.34) we notice that if $|z| \geq 2|y-z|$, then

$$
|z| \geq 2|y-z| \geq 2|z|-2|y| \quad \text { and so }|z| \leq 2|y|
$$

## Asymptotic profile of positive solutions

hence

$$
\begin{align*}
& \mathrm{III}= \frac{1}{2 \pi} \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{|z| \geq 2|y-z|\}} \log |z|\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& \leq \frac{1}{2 \pi} \log (2|y|) \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{|z| \geq 2|y-z|\}}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
&\left.\begin{array}{c}
(4.26) \\
\leq \\
2 \pi \\
\\
\\
\\
\\
\quad+\int_{\left\{\frac{r}{\varepsilon_{j, p}} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\}}(2|y|)\left[\beta_{j, p}-\int_{B_{R_{\varepsilon}}(0)}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z\right] \\
\quad(4.37) \\
\leq \\
2 \pi \\
\log (2|y|)
\end{array} \beta_{j, p}-\int_{B_{R_{\varepsilon}(0)}}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z+\varepsilon\right]
\end{align*}
$$

Finally we estimate the fourth integral. Observe that for any $y \in\left\{2 R_{\varepsilon} \leq\right.$ $\left.|y| \leq \frac{r}{\varepsilon_{j, p}}\right\}$ one has the inclusion

$$
\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}},|y-z| \leq 1\right\} \subset B_{\overline{\varepsilon_{j, p}}+1}(0)
$$

and that, since for $p$ large enough $B_{r+\varepsilon_{j, p}}\left(y_{j}\right) \subset B_{2 r}\left(x_{j}\right)$, then by scaling, also

$$
B_{\frac{r}{\varepsilon_{j, p}}+1}(0) \subset B_{\frac{2 r}{\varepsilon_{j, p}}}\left(\frac{x_{j}-y_{j, p}}{\varepsilon_{j, p}}\right)
$$

so that, as a consequence, the estimate in (4.25) holds for $z \in\left\{R_{\varepsilon} \leq|z| \leq\right.$ $\left.\frac{2 r}{\varepsilon_{j, p}},|y-z| \leq 1\right\}$. Hence

$$
\begin{align*}
\mathrm{IV}= & \frac{1}{2 \pi} \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{|z| \geq 2|y-z|\}} \log \frac{1}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
= & \frac{1}{2 \pi} \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{|y-z| \leq 1\}} \log \frac{1}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& +\frac{1}{2 \pi} \int_{\left\{R_{\varepsilon} \leq|z| \leq \frac{2 r}{\varepsilon_{j, p}}\right\} \cap\{2 \leq 2|y-z| \leq|z|\}} \log \frac{1}{|y-z|}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p} \mathrm{~d} z \\
& (4.25)  \tag{4.39}\\
& \leq \frac{1}{2 \pi} \int_{\{|y-z| \leq 1\}} \log \frac{1}{|y-z|} \mathrm{d} z=O(1)
\end{align*}
$$

where we have also used that $\log t \leq 0$ if $t \leq 1$.
At last, substituting (4.35), (4.36), (4.38), (4.39) into (4.34), using (4.29), that $\frac{2 R_{\varepsilon}}{|y|} \leq 1$ and observing that, by Proposition $4.3,\left|\beta_{j, p}-8 \pi\right|<\varepsilon$ for $p$

## F. De Marchis et al.

large, we obtain the thesis, indeed:

$$
\begin{align*}
w_{j, p}(y) \leq & \frac{1}{2 \pi} \log \frac{2 R_{\varepsilon}}{|y|}(8 \pi-\varepsilon) \\
& +\frac{1}{2 \pi} \log 2\left(\beta_{j, p}-(8 \pi-\varepsilon)+\varepsilon\right) \\
& +\frac{1}{2 \pi} \log (2|y|)\left(\beta_{j, p}-(8 \pi-\varepsilon)+\varepsilon\right)+O(1) \\
\leq & \frac{1}{2 \pi}\left(\beta_{j, p}-2\left(\beta_{j, p}-8 \pi\right)-3 \varepsilon\right) \log \frac{1}{|y|}+O(1) \\
\leq & \left(\frac{\beta_{j, p}}{2 \pi}-\varepsilon\right) \log \frac{1}{|y|}+O(1) . \tag{4.40}
\end{align*}
$$

## 5. Conclusion of the proof of Theorem 1.1

Let $r>0$ be as in (4.1) and let $y_{j, p}$ for $j=1, \ldots, N$ be the local maxima of $u_{p}$ as in (4.2). Let us define

$$
\begin{equation*}
m_{j}:=\lim _{p \rightarrow+\infty} u_{p}\left(y_{p, j}\right)=\lim _{p \rightarrow+\infty}\left\|u_{p}(x)\right\|_{L^{\infty}\left(\overline{B_{2 r}\left(x_{j}\right)}\right)}, \quad \text { for } j=1, \ldots, N \tag{5.1}
\end{equation*}
$$

(observe that (2.16) implies that $m_{j}<+\infty$ for any $j=1, \ldots, N$ ).
Proposition 5.1. One has

$$
\begin{equation*}
\gamma_{j}=8 \pi \cdot m_{j} \tag{5.2}
\end{equation*}
$$

( $\gamma_{j}$ defined by Lemma 3.1);

$$
\begin{gather*}
\lim _{p \rightarrow+\infty} p \int_{\Omega}\left|\nabla u_{p}\right|^{2}=8 \pi \sum_{j=1}^{N} m_{j}^{2}  \tag{5.3}\\
N=k \tag{5.4}
\end{gather*}
$$

where $k$ is the integer in Proposition 2.4.
Proof. We prove (5.2). From the expression of $\gamma_{j}$ given by Lemma 3.1 combined with Proposition 3.2 and the results in (4.18), we have

$$
\begin{aligned}
& \gamma_{j}=\lim _{\delta \rightarrow 0} \lim _{p \rightarrow+\infty} p \int_{B_{\delta}\left(x_{j}\right)} u(x)^{p} \mathrm{~d} x=\lim _{\delta \rightarrow 0} \lim _{p \rightarrow+\infty} \alpha_{j, p}(\delta) u_{p}\left(y_{j, p}\right) \\
& \stackrel{(4.18)}{=} \lim _{p \rightarrow+\infty} \beta_{j, p} u_{p}\left(y_{j, p}\right)=8 \pi \cdot m_{j}
\end{aligned}
$$

where the last equality follows from Proposition 4.3.

Next we prove (5.3). Observe that

$$
\begin{align*}
p \int_{\Omega}\left|\nabla u_{p}\right|^{2} & =p \int_{\Omega} u_{p}(x)^{p+1} \mathrm{~d} x \\
& =\sum_{j=1}^{N} p \int_{B_{r}\left(x_{j}\right)} u_{p}(x)^{p+1} \mathrm{~d} x+p \int_{\Omega \backslash \cup_{j=1}^{N} B_{r}\left(x_{j}\right)} u_{p}(x)^{p+1} \mathrm{~d} x \\
& \stackrel{(2.27)}{=} \sum_{j=1}^{N} p \int_{B_{r}\left(x_{j}\right)} u_{p}(x)^{p+1} \mathrm{~d} x+o_{p}(1) \tag{5.5}
\end{align*}
$$

Moreover

$$
\begin{equation*}
p \int_{B_{r}\left(x_{j}\right)} u_{p}(x)^{p+1} \mathrm{~d} x=p \int_{B_{\frac{r}{2}}\left(y_{j, p}\right)} u_{p}(x)^{p+1} \mathrm{~d} x+o_{p}(1) \tag{5.6}
\end{equation*}
$$

since for $p$ large enough $B_{\frac{r}{3}}\left(x_{j}\right) \subset B_{\frac{r}{2}}\left(y_{j, p}\right) \subset B_{r}\left(x_{j}\right)$ so that

$$
p \int_{B_{r}\left(x_{j}\right) \backslash B_{\frac{r}{2}}\left(y_{j, p}\right)} u_{p}(x)^{p+1} \mathrm{~d} x \leq p \int_{\left\{\frac{r}{3}<\left|x-x_{j}\right|<r\right\}} u_{p}(x)^{p+1} \mathrm{~d} x \stackrel{(2.27)}{=} o_{p}(1)
$$

Let us consider the remaining term in the right-hand side of (5.6). We want to rescale $u_{p}$ around the maximum point $y_{j, p}$ defining $w_{j, p}$ as in (4.3) and then pass to the limit.
Observe that, since by definition $w_{j, p} \leq 0$, then

$$
\begin{equation*}
0 \leq\left(1+\frac{w_{j, p}(z)}{p}\right)^{p+1}=e^{(p+1) \log \left(1+\frac{w_{j, p}(z)}{p}\right)} \leq e^{(p+1) \frac{w_{j, p}(z)}{p}}=e^{w_{j, p}(z)} \leq C \frac{1}{|z|^{3}} \tag{5.7}
\end{equation*}
$$

where the last inequality is due to the combination of Lemma 4.4 and Proposition 4.3, so that it holds provided $2 R_{\varepsilon} \leq|z| \leq \frac{r}{\varepsilon_{j, p}}$ and $p$ is sufficiently large. Instead, when $|z| \leq 2 R_{\varepsilon}$, then by (4.24) and (4.25) for $p$ sufficiently large

$$
\begin{equation*}
0 \leq\left(1+\frac{w_{j, p}(z)}{p}\right)^{p+1} \leq 1, \quad \text { for }|z| \leq 2 R_{\varepsilon} \tag{5.8}
\end{equation*}
$$

Thanks to (5.7) and (5.8) we can apply the dominated convergence theorem deducing that

$$
\begin{align*}
\frac{p}{u_{p}\left(y_{j, p}\right)^{2}} \int_{B_{\frac{r}{2}}\left(y_{j, p}\right)} u_{p}(x)^{p+1} \mathrm{~d} x & =\int_{B_{\frac{r}{2 \varepsilon}}^{2 \varepsilon \varepsilon_{j, p}}(0)}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p+1} \mathrm{~d} z \\
& \longrightarrow \tag{5.9}
\end{align*}
$$

Substituting (5.9) into (5.6), we then have

$$
\begin{equation*}
p \int_{B_{r}\left(x_{j}\right)} u_{p}(x)^{p+1} \mathrm{~d} x=\left(8 \pi+o_{p}(1)\right) m_{j}^{2}+o_{p}(1) \tag{5.10}
\end{equation*}
$$

By substituting (5.10) into (5.5) we get (5.3). Finally we show (5.4). We have defined $N \in \mathbb{N} \backslash\{0\}$ to be the number of points in the concentration set $\mathcal{S}$;

## F. De Marchis et al.

hence $N \leq k$. Recall that in (3.1) without loss of generality we have relabeled the sequences of points $x_{i, p}, i=1, \ldots, k$, in such a way that

$$
x_{j, p} \rightarrow x_{j}, \forall j=1, \ldots, N \quad \text { and } \quad \mathcal{S}=\left\{x_{1}, x_{2}, \ldots, x_{N}\right\}
$$

and without loss of generality we may also assume that

$$
R_{k, p}\left(y_{j, p}\right)=\left|x_{j, p}-y_{j, p}\right| .
$$

Then Proposition 2.7 applied to the family $y_{j, p}$ implies that $\lim \sup _{p \rightarrow+\infty} \frac{\mu_{j, p}}{\varepsilon_{j, p}}$ $\leq 1$, but, by the definition of $y_{j, p}$ as a maximum of $u_{p}$ on $B_{2 r}\left(x_{j}\right)$ and the fact that $x_{j, p} \rightarrow x_{j}$, we also have that $\frac{\mu_{j, p}}{\varepsilon_{j, p}} \geq 1$ for $p$ large. As a consequence

$$
\begin{equation*}
\lim _{p \rightarrow+\infty} u_{p}\left(x_{j, p}\right)=\lim _{p \rightarrow+\infty} u_{p}\left(y_{j, p}\right)=m_{j}, \quad \forall j=1, \ldots, N . \tag{5.11}
\end{equation*}
$$

Assume now by contradiction that $N<k$. Since, by Proposition 2.4, $\left(\mathcal{P}_{1}^{k}\right)$ and $\left(\mathcal{P}_{2}^{k}\right)$ hold, then Lemma 2.3 applies and so we have

$$
\begin{aligned}
\lim _{p \rightarrow+\infty} p \int_{\Omega}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x & \geq 8 \pi \sum_{i=1}^{k} \lim _{p}\left(u_{p}\left(x_{i, p}\right)\right)^{2} \\
& \stackrel{(5.11)}{=} 8 \pi \sum_{j=1}^{N} m_{j}^{2}+8 \pi \sum_{i=N+1}^{k} \lim _{p}\left(u_{p}\left(x_{i, p}\right)\right)^{2} \\
& \stackrel{(2.20)}{\geq} 8 \pi \sum_{j=1}^{N} m_{j}^{2}+8 \pi>8 \pi \sum_{j=1}^{N} m_{j}^{2} .
\end{aligned}
$$

which contradicts (5.3) and this concludes the proof.
By the results in Sect. 3 and (5.4) in Proposition 5.1 we have that $\mathcal{S}=$ $\left\{x_{1}, x_{2}, \ldots, x_{k}\right\} \subset \Omega$. We now locate the concentration points $x_{i}, i=1, \ldots, k$.

Proposition 5.2. The concentration points $x_{i}, i=1, \ldots, k$, satisfy (1.7), namely

$$
m_{i} \nabla_{x} H\left(x_{i}, x_{i}\right)+\sum_{\ell \neq i} m_{\ell} \nabla_{x} G\left(x_{i}, x_{\ell}\right)=0
$$

Proof. Let $\delta>0$ be small enough so that $B_{\delta}\left(x_{i}\right) \subset \Omega$ and $B_{\delta}\left(x_{i}\right) \cap B_{\delta}\left(x_{j}\right)=\emptyset$, $i \neq j$. Clearly it is enough to prove the identity for $i=1$.

Multiplying equation (1.1) by $\frac{\partial u_{p}}{\partial x_{j}}$, for $j=1,2$, and integrating on $B_{\delta}\left(x_{1}\right)$ we have that

$$
\begin{align*}
-\int_{B_{\delta}\left(x_{1}\right)} \Delta u \frac{\partial u}{\partial x_{j}} \mathrm{~d} x & =\int_{B_{\delta}\left(x_{1}\right)}|u|^{p-1} u \frac{\partial u}{\partial x_{j}} \mathrm{~d} x=\frac{1}{p+1} \int_{B_{\delta}\left(x_{1}\right)} \frac{\partial}{\partial x_{j}}|u|^{p+1} \mathrm{~d} x \\
& =\frac{1}{p+1} \int_{\partial B_{\delta}\left(x_{1}\right)}|u|^{p+1} \nu_{j} \mathrm{~d} s_{x} \tag{5.12}
\end{align*}
$$

where $\nu_{j}$ are the components of the outer normal at $\partial B_{\delta}\left(x_{1}\right)$.

## Asymptotic profile of positive solutions

For the first term

$$
\begin{align*}
& \int_{B_{\delta}\left(x_{1}\right)} \Delta u \frac{\partial u}{\partial x_{j}} \mathrm{~d} x \\
& \quad=\int_{B_{\delta}\left(x_{1}\right)} \sum_{h} \frac{\partial^{2} u}{\partial x_{h}^{2}} \frac{\partial u}{\partial x_{j}} \mathrm{~d} x \\
& \quad=\int_{B_{\delta}\left(x_{1}\right)} \sum_{h} \frac{\partial}{\partial x_{h}}\left(\frac{\partial u}{\partial x_{j}} \frac{\partial u}{\partial x_{h}}\right) \mathrm{d} x-\int_{B_{\delta}\left(x_{1}\right)} \sum_{h}\left(\frac{\partial^{2} u}{\partial x_{h} \partial x_{j}} \frac{\partial u}{\partial x_{h}}\right) \mathrm{d} x \\
& \quad=\int_{\partial B_{\delta}\left(x_{1}\right)} \sum_{h}\left(\frac{\partial u}{\partial x_{j}} \frac{\partial u}{\partial x_{h}}\right) \nu_{h} \mathrm{~d} s_{x}-\frac{1}{2} \int_{B_{\delta}\left(x_{1}\right)} \frac{\partial}{\partial x_{j}}\left(\sum_{h}\left(\frac{\partial u}{\partial x_{h}}\right)^{2}\right) \mathrm{d} x \\
& \quad=\int_{\partial B_{\delta}\left(x_{1}\right)} \frac{\partial u}{\partial x_{j}} \frac{\partial u}{\partial \nu} \mathrm{~d} s_{x}-\frac{1}{2} \int_{\partial B_{\delta}\left(x_{1}\right)}|\nabla u|^{2} \nu_{j} \mathrm{~d} s_{x} . \tag{5.13}
\end{align*}
$$

Hence, combining (5.12) with (5.13) and multiplying by $p^{2}$ we get:

$$
\begin{align*}
& \frac{p^{2}}{p+1} \int_{\partial B_{\delta}\left(x_{1}\right)}\left|u_{p}\right|^{p+1} \nu_{j} \mathrm{~d} s_{x}+p^{2} \int_{\partial B_{\delta}\left(x_{1}\right)} \frac{\partial u_{p}}{\partial x_{j}} \frac{\partial u_{p}}{\partial \nu} \mathrm{~d} s_{x} \\
& \quad-\frac{p^{2}}{2} \int_{\partial B_{\delta}\left(x_{1}\right)}\left|\nabla u_{p}\right|^{2} \nu_{j} \mathrm{~d} s_{x}=0 . \tag{5.14}
\end{align*}
$$

The first term of (5.14) can be estimated as follows:

$$
\left.\left|\frac{p^{2}}{p+1} \int_{\partial B_{\delta}\left(x_{1}\right)}\right| u_{p}\right|^{p+1} \nu_{j} \mathrm{~d} s_{x} \left\lvert\, \leq \frac{p}{p+1} 2 \pi \delta\left\|p u_{p}^{p+1}\right\|_{L^{\infty}\left(\partial B_{\delta}\left(x_{1}\right)\right)} \underset{p \rightarrow+\infty}{\stackrel{(2.26)}{\longrightarrow}} 0\right.
$$

so letting $p \rightarrow+\infty$ in (5.14) we get, for $j=1,2$,

$$
\begin{gathered}
\int_{\partial B_{\delta}\left(x_{1}\right)} \frac{\partial}{\partial x_{j}}\left(\sum_{i=1}^{N} m_{i} G\left(x, x_{i}\right)\right) \frac{\partial}{\partial \nu}\left(\sum_{i=1}^{N} m_{i} G\left(x, x_{i}\right)\right) \mathrm{d} s_{x} \\
-\frac{1}{2} \int_{\partial B_{\delta}\left(x_{1}\right)}\left|\nabla\left(\sum_{i=1}^{N} m_{i} G\left(x, x_{i}\right)\right)\right|^{2} \nu_{j} \mathrm{~d} s_{x}=0
\end{gathered}
$$

where we have used Theorem 1.1(ii) (which holds by virtue of Lemma 3.1 and Proposition 5.1).

Computing the last integral as in [9, pp. 511-512] we obtain
$-m_{1}\left[m_{1} \frac{\partial}{\partial x_{j}} H\left(x_{j, r}^{*}, x_{1}\right)+\sum_{\ell \neq 1} m_{\ell} \frac{\partial}{\partial x_{j}} G\left(x_{j, r}^{*}, x_{\ell}\right)\right]+o_{\delta}(1)=0 \quad$ for $j=1,2$,
where $x_{j, r}^{*} \rightarrow x_{1}$ as $\delta \rightarrow 0, j=1,2$. Hence passing to the limit as $\delta \rightarrow 0$ we derive the desired relations

$$
m_{1} \frac{\partial}{\partial x_{j}} H\left(x_{1}, x_{1}\right)+\sum_{\ell \neq 1} m_{\ell} \frac{\partial}{\partial x_{j}} G\left(x_{1}, x_{\ell}\right)=0 \quad \text { for } j=1,2 .
$$

We now estimate from below the numbers $m_{j}, j=1, \ldots, N$, in (5.1) and so the $L^{\infty}$-norm of $u_{p}$. We will need the following result:

## F. De Marchis et al.

Lemma 5.3 [12, Lemma 2.1]. Let $B \subset \mathbb{R}^{2}$ be a smooth bounded domain. Then for every $p>1$ there exists $D_{p}>0$ such that

$$
\begin{equation*}
\|v\|_{L^{p+1}(B)} \leq D_{p}(p+1)^{1 / 2}\|\nabla v\|_{L^{2}(B)}, \quad \forall v \in H_{0}^{1}(B) \tag{5.15}
\end{equation*}
$$

Moreover,

$$
\begin{equation*}
\lim _{p \rightarrow+\infty} D_{p}=\frac{1}{(8 \pi e)^{1 / 2}} \tag{5.16}
\end{equation*}
$$

Proposition 5.4. We have

$$
m_{j} \geq \sqrt{e}, \quad \forall j=1, \ldots, N
$$

and hence

$$
\lim _{p \rightarrow+\infty}\left\|u_{p}\right\|_{\infty} \geq \sqrt{e}
$$

Proof. Let $r$ be as in (4.1). Let us take $\chi \in C^{2}([0,2 r)), \chi(s)=1$ for $s \in[0, r)$, $\chi(s)=0$ for $s \in\left[\frac{3}{4} r, 2 r\right)$ and consider the cut-off function $\chi_{j}(x):=\chi\left(\left|x-x_{j}\right|\right)$. Then $\widetilde{u}_{p, j}:=u_{p} \chi_{j} \in H_{0}^{1}\left(B_{2 r}\left(x_{j}\right)\right)$ and satisfies

$$
\begin{align*}
& p \int_{B_{2 r}\left(x_{j}\right)}\left|\nabla \widetilde{u}_{p, j}\right|^{2} \mathrm{~d} x= p \int_{B_{r}\left(x_{j}\right)}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x+p \int_{\left\{r \leq\left|x-x_{j}\right| \leq \frac{3}{4} r\right\}}\left|\nabla u_{p}\right|^{2} \chi_{j}^{2} \mathrm{~d} x \\
&+p \int_{\left\{r \leq\left|x-x_{j}\right| \leq \frac{3}{4} r\right\}} u_{p}^{2}\left|\nabla \chi_{j}\right|^{2} \mathrm{~d} x \\
&+2 p \int_{\left\{r \leq\left|x-x_{j}\right| \leq \frac{3}{4} r\right\}} u_{p}\left\langle\nabla u_{p}, \nabla \chi_{j}\right\rangle \chi_{j} \mathrm{~d} x \\
& \stackrel{(2.24)}{=} p \int_{B_{r}\left(x_{j}\right)}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x+o_{p}(1) . \tag{5.17}
\end{align*}
$$

Moreover,

$$
\begin{align*}
& p \int_{B_{2 r}\left(x_{j}\right)} \widetilde{u}_{p, j}^{p+1} \mathrm{~d} x=p \int_{B_{r}\left(x_{j}\right)} u_{p}^{p+1} \mathrm{~d} x+p \int_{\left\{r \leq\left|x-x_{j}\right| \leq \frac{3}{4} r\right\}} u_{p}^{p+1} \chi_{j}^{p+1} \mathrm{~d} x \\
& \stackrel{(2.26)}{=} p \int_{B_{r}\left(x_{j}\right)} u_{p}^{p+1} \mathrm{~d} x+o_{p}(1) \tag{5.18}
\end{align*}
$$

By (5.17) and (5.18), applying (5.15) to $\widetilde{u}_{p, j}$ and using (5.16), we then get $p \int_{B_{r}\left(x_{j}\right)}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x \stackrel{(5.17)}{=} p \int_{B_{2 r}\left(x_{j}\right)}\left|\nabla \widetilde{u}_{p, j}\right|^{2} \mathrm{~d} x+o_{p}(1)$

$$
\begin{align*}
& \stackrel{(5.15)}{\geq} \frac{p}{(p+1) p^{\frac{2}{p+1}} D_{p}^{2}}\left[p \int_{B_{2 r}\left(x_{j}\right)} \widetilde{u}_{p, j}^{p+1} \mathrm{~d} x\right]^{\frac{2}{p+1}}+o_{p}(1) \\
& \stackrel{(5.16)}{=}\left(8 \pi e+o_{p}(1)\right)\left[p \int_{B_{2 r}\left(x_{j}\right)} \widetilde{u}_{p, j}^{p+1} \mathrm{~d} x\right]^{\frac{2}{p+1}}+o_{p}(1) \\
& \stackrel{(5.18)}{=}\left(8 \pi e+o_{p}(1)\right)\left[p \int_{B_{r}\left(x_{j}\right)} u_{p}^{p+1} \mathrm{~d} x+o_{p}(1)\right]^{\frac{2}{p+1}}+o_{p}(1) \\
& =8 \pi e+o_{p}(1) \tag{5.19}
\end{align*}
$$

where in the last line we have used that $c \leq p \int_{B_{r}\left(x_{j}\right)} u_{p}^{p+1} \mathrm{~d} x \leq C$, which follows by the assumption on the energy bound (1.2) and from (4.5). Finally, observe that integrating by parts and using the Eq. (1.1) we also have

$$
\begin{align*}
& p \int_{B_{r}\left(x_{j}\right)}\left|\nabla u_{p}\right|^{2} \mathrm{~d} x=p \int_{B_{r}\left(x_{j}\right)} u_{p}^{p+1} \mathrm{~d} x-p \int_{\partial B_{r}\left(x_{j}\right)} u_{p} \frac{\partial u_{p}}{\partial \nu} \\
& \stackrel{(2.24)}{=} p \int_{B_{r}\left(x_{j}\right)} u_{p}^{p+1} \mathrm{~d} x+o_{p}(1) \\
& \stackrel{\text { as }}{ } \stackrel{\stackrel{\text { in }}{=}(5.6)}{=} p \int_{B_{\frac{r}{2}}\left(y_{j, p}\right)} u_{p}(x)^{p+1} \mathrm{~d} x+o_{p}(1) \\
& \stackrel{(4.3)}{=} u_{p}\left(y_{j, p}\right)^{2} \int_{B_{\frac{r}{2}}(0)}\left(1+\frac{w_{j, p}(z)}{p}\right)^{p+1} \mathrm{~d} z \\
& \stackrel{(*)}{=} u_{p}\left(y_{j, p}\right)^{2}\left(o_{p}(1)+\int_{\mathbb{R}^{2}} e^{U(z)} \mathrm{d} z\right) \\
&=u_{p}\left(y_{j, p}\right)^{2} 8 \pi+o_{p}(1) \tag{5.20}
\end{align*}
$$

where $(*)$ follows by the dominated convergence theorem in the same way as in (5.9). Putting together (5.19) and (5.20) we get the conclusion.

Proof of Theorem 1.1. The statements of Theorem 1.1 have been proved in the various propositions obtained so far. In particular (i) is the statement (2.24) in Proposition 2.4, (ii) derives from Lemma 3.1 and (5.2) and (5.4) of Proposition 5.1. The energy limit (iii) is claim (5.3) in Proposition 5.1, together with (5.4). The statement (iv) is the assertion of Proposition 5.2 and (v) is proved in Proposition 5.4.
