Part I

Giuseppe Crasta and Maria Prossali

Geometric issues in PDE problems related to the infinity Laplace operator — 5

- 1.1 Introduction — 5
- 1.2 On the Dirichlet problem — 6
- 1.3 On the overdetermined problem: the simple (web)-case — 8
- 1.4 On stadium-like domains — 11
- 1.5 On the overdetermined problem: the general (non-web)-case — 21
- 1.6 Open problems — 28

H. Harbrecht and M. D. Peters

Solution of free boundary problems

in the presence of geometric uncertainties — 20

- 2.1 Introduction — 20
- 2.2 Modelling uncertain domains — 22
 - 2.2.1 Notation — 22
 - 2.2.2 Random interior boundary — 23
 - 2.2.3 Random exterior boundary — 23
 - 2.2.4 Expectation and variance of the domain — 24
 - 2.2.5 Stochastic quadrature method — 26
 - 2.2.6 Analytical example — 27
- 2.3 Computing free boundaries — 28
 - 2.3.1 Trial method — 28
 - 2.3.2 Discretizing the free boundary — 29
 - 2.3.3 Boundary integral equations — 30
 - 2.3.4 Expectation and variance of the potential — 31
- 2.4 Numerical results — 32
 - 2.4.1 First example — 32
 - 2.4.2 Second example — 34
 - 2.4.3 Third example — 34
 - 2.4.4 Fourth example — 36
- 2.5 Conclusion — 38

M. Hintermüller and S. Wegner

Distributed and boundary control problems for the semidiscrete

Cahn–Hilliard/Navier–Stokes system with nonsmooth Ginzburg–Landau energies — 40

- 3.1 Introduction — 40

1.2	Optimal control problem for the time discretization — 43
1.3	Yosida approximation and gradient method — 47
1.3.1	Sequential Yosida approximation — 47
1.3.2	Steepest-descent method with expansive line search — 48
1.3.3	Newton's method for the primal system — 48
1.4	Finite element approximation — 48
1.5	Numerical results — 51
1.5.1	Disk to a ring segment — 53
1.5.2	Ring to disks — 54
1.5.3	Cold pattern of disks — 57
1.5.4	Cold pattern of finger-like regions — 59
1.6	Conclusions — 60

Victor A. Kuvshinov

High order topological expansions for Helmholtz problems in \mathbb{R}^2 — 64

4.1	Introduction — 64
4.2	Background Helmholtz problem — 64
4.2.1	Inner asymptotic expansion by Fourier series in near field — 68
4.3	Helmholtz problems for geometric objects under Neumann (sound hard) boundary condition — 74
4.3.1	Outer asymptotic expansion by Fourier series in far field — 77
4.3.2	Uniform asymptotic expansion of solution of the Neumann problem — 81
4.3.3	Inverse Helmholtz problem under Neumann boundary condition — 85
4.4	Helmholtz problems for geometric objects under Dirichlet (sound soft) boundary condition — 92
4.4.1	Outer and inner asymptotic expansions by Fourier series — 93
4.4.2	High order uniform asymptotic expansion of the Dirichlet problem — 98
4.4.3	Inverse Helmholtz problem under Dirichlet boundary condition — 102
4.5	Helmholtz problems for geometric objects under Robin (impedance) boundary condition — 105
4.5.1	Outer asymptotic expansion by Fourier series in far field — 107
4.5.2	Combined uniform asymptotic expansion of the Robin problem — 111
4.5.3	Inverse Helmholtz problem under Robin boundary condition — 113
4.5.4	Necessary optimality condition for the topology optimization — 118

Elie Bretin and Simon Mazzeo

On a new phase field model for the approximation of interfacial energies of multiphase systems — 121

5.1	Introduction — 121
5.2	Derivation of the phase field model — 123

- 9.1.1 General theory: duality, equivalent formulations, and many particles limit — 216
- 9.1.2 The Monge problem: deterministic examples and counterexamples — 220
- 9.2 Multi-marginal OT with repulsive harmonic cost — 230
- 9.3 Multi-marginal OT for the determinant — 238
- 9.4 Numerics — 242
- 9.4.1 The regularized problem and the iterative proportional fitting procedure — 243
- 9.4.2 Numerical experiments: Coulomb cost — 244
- 9.4.3 Numerical experiments: repulsive harmonic cost — 248
- 9.4.4 Numerical experiments: Determinant cost — 250
- 9.5 Conclusion — 252

Benoit Bichsel

Wardrop equilibria, long-term variant, degenerate anisotropic PDEs and numerical approximations — 257

- 10.1 Introduction — 257
- 10.1.1 Presentation of the general discrete model — 257
- 10.1.2 Assumptions and preliminary results — 259
- 10.2 Equivalence with Beckmann problem — 264
- 10.3 Characterization of minimizers via anisotropic elliptic PDEs — 267
- 10.4 Regularity when the α_i 's and β_i 's are constant — 269
- 10.5 Numerical simulations — 273
- 10.5.1 Description of the algorithm — 273
- 10.5.2 Numerical schemes and convergence study — 275

Faouf Pegon

On the Lagrangian branched transport model and the equivalence with its Eulerian formulation — 281

- 11.1 The Lagrangian model: irrigation plans — 282
- 11.1.1 Notation and general framework — 282
- 11.1.2 The Lagrangian irrigation problem — 284
- 11.1.3 Existence of minimizers — 285
- 11.2 The energy formula — 290
- 11.2.1 Rectifiable irrigation plans — 290
- 11.2.2 Proof of the energy formula — 294
- 11.2.3 Optimal irrigation plans are simple — 294
- 11.3 The Eulerian model: irrigation flows — 297
- 11.3.1 The discrete model — 298
- 11.3.2 The continuous model — 298
- 11.4 Equivalence between models — 300

11.A.1	From Lagrangian to Eulerian — 300
11.A.2	From Eulerian to Lagrangian — 301
11.A.3	The equivalence theorem — 303

Maxime Lébeaud

On some nonlinear evolution systems which are perturbations of Wasserstein gradient flows — 304

12.1	Introduction — 304
12.2	Wasserstein space and main result — 305
12.2.1	The Wasserstein distance — 304
12.2.2	Main result — 307
12.3	Semi-implicit RK scheme — 308
12.4	α -flows and gradient estimate — 313
12.4.1	α -flows — 313
12.4.2	Gradient estimate — 315
12.5	Passage to the limit — 317
12.5.1	Weak and strong convergences — 318
12.5.2	Limit of the discrete system — 321
12.6	The case of a bounded domain Ω — 324
12.7	Uniqueness of solutions — 328

B. Maury and A. Poux

Pressureless Euler equations with maximal density constraint: a time-splitting scheme — 333

13.1	Introduction — 333
13.2	Time-stepping scheme — 339
13.2.1	Time discretization strategy — 339
13.2.2	The scheme — 341
13.3	Numerical illustrations — 347
13.3.1	Space discretization scheme — 347
13.3.2	Numerical tests — 349
13.4	Conclusive remarks — 350

Horst Osberger and Daniel Matthes

Convergence of a fully discrete variational scheme for a thin-film equation — 354

14.1	Introduction — 354
14.1.1	The equation and its properties — 354
14.1.2	Definition of the discretization — 358
14.1.3	Main results — 360
14.1.4	Relation to the literature — 361
14.1.5	Key estimates — 362
14.1.6	Structure of the paper — 363
